Tonga MICS 2019

Survey Findings Report

Pacific
Community
Communauté
du Pacifique

The Tonga Multiple Indicator Cluster Survey (MICS) was carried out in 2019 by Tonga Statistics Department (TSD) in collaboration with Ministry of Health, Ministry of Internal Affairs – Women's Affairs and Gender Equality Division and other government ministries as part of the Global MICS Programme. Technical support was provided by the United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA) and Pacific Community (SPC) with government funding and financial support of UNICEF and UNFPA through Ministry of Health.

The Global MICS Programme was developed by UNICEF in the 1990s as an international multi-purpose household survey programme to support countries in collecting internationally comparable data on a wide range of indicators on the situation of children and women. MICS surveys measure key indicators that allow countries to generate data for use in policies, programmes, and national development plans, and to monitor progress towards the Sustainable Development Goals (SDGs) and other internationally agreed upon commitments.

The objective of this report is to facilitate the timely dissemination and use of results from the Tonga MICS 2019. The report contains detailed information on the survey methodology, standard MICS and country specific tables. The report is accompanied by a series of Statistical Snapshots of the main findings of the survey.

For more information on the Global MICS Programme, please go to mics.unicef.org.

SUMMARY TABLE OF SURVEY IMPLEMENTATION AND THE SURVEY POPULATION

Survey sample and implementation			
Sample frame	2016 Tonga Population and Housing Census	Questionnaires	Household Women (age 15-49) Men (age 15-49) Children under five Children age 5-17 Water Quality Testing Vaccination Records at Health Facility
- Updated	June 2019		
Interviewer training	Sept - Oct 2019	Fieldwork	Oct - Dec 2019
Survey sample			
Households		Children under five	
- Sampled	2,751	- Eligible	1,378
- Occupied	2,543	- Mothers/caretakers interviewed	1,347
- Interviewed	2,498	- Response rate (Per cent)	97.8
- Response rate (Per cent)	98.2		
Women (age 15-49)		Children age 5-17	
- Eligible for interviews	3,157	- Eligible	1,664
- Interviewed	2,903	- Mothers/caretakers interviewed	1,628
- Response rate (Per cent)	92.0	- Response rate (Per cent)	97.8
Men (age 15-49)		Water Quality Testing	
- Eligible for interviews	1,453	- Eligible	628
- Interviewed	1,232	- Interviewed	613
- Response rate (Per cent)	84.8	- Response rate (Per cent)	97.6

Survey population			
Average household size	5.3	Percentage of population living in	
Percentage of population under:		- Urban areas	23.1
- Age 5	10.3	- Rural areas	76.9
- Age 18	41.1		
Percentage of women age 15-49 years with at least one live birth in the last 2 years	14.5	Divisions:	
		- Tongatapu	70.5
		- Vava'u	15.7
		- Ha'apai	7.1
		- 'Eua	5.4
		- Ongi Niua	1.2

FOREWORD

This is the first Multiple Indicator Cluster Survey (MICS) implemented in Tonga, it's named Tonga Multiple Indicator Cluster Survey (TMICS) 2019. It generates information on women, men and children in Tonga based on the MICS framework with additional modules from the Demographic and Health Survey (DHS).

The findings provide information on 213 MICS indicators, among which are 33 indicators for the Sustainable Development Goals (SDGs) and 23 from the Pacific Sustainable Development Indicators.

Key facts highlighting the vulnerabilities of children to COVID-19 are also released. These findings are critical to informed decision-making by the government, key stakeholders, as well as development partners, in providing support for children, their families and those who are most in need. Some of the survey findings that will also assist in the COVID-19 response planning include access to the internet and computers at home, access to soap and running water, vulnerability to physical punishment, access to education, health and the regularity of immunization services

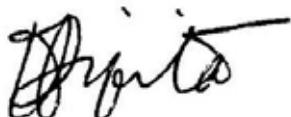

“Better Data, Better Lives” has been the theme for the last 5 years for World Statistics Day and Tonga has adopted the same theme for its annual Statistics Day for the past 5 years. Tonga MICS is part of our newly development in data collection that has valuable, up to date information on the livelihoods of Tonga women and men ages 15-49, children ages 5-17 and children under 5 years of age.

In support of the objective “Leaving No one Behind” of 2030 Agenda, MICS allows disaggregation by wealth quintiles, age, sex, disability, education status, and religion and particularly disaggregation by Island division which was not available in previous national surveys. This depth of information enables effective monitoring and reporting on the development Tonga makes towards national, regional priorities as well global SDGs.

Evidence based decision-making and effective planning are essential to good governance. Tonga Statistics Department has confidence that the data generated through Tonga MICS will make a significant contribution to the livelihoods of the people of Tonga.

The results presented in the TMICS report are prepared in close collaboration with the key stakeholders who took part in result review of TMICS in May 2020. These include representatives from the Ministry of Health, Ministry of Education, Ministry of Justice, Ministry of Internal Affairs - WAGED & Social Protection Division and other Organizations such as, Women and Children Crisis Centre (WCCC), Tonga National Centre for Women and Children (TNCWC), Ma'a Fafine mo e Famili (MFF), SPC, UNFPA and UNICEF.

1 INTRODUCTION

This report is based on the Tonga Multiple Indicator Cluster Survey (MICS), conducted in 2019 by the Tonga Statistics Department in collaboration with Ministry of Health with technical support of Ministry of Internal Affairs – Women's Affairs and Gender Equality Division (WAGED) and other key Government Ministries UNICEF, UNFPA, the Pacific Community (SPC) and other partners. The survey provides statistically sound and internationally comparable data essential for developing evidence-based policies and programs, and for monitoring progress toward national goals and global commitments.

The Tonga national development plan, *Tonga Strategic Development Framework (TSDF) II 2015-2025* underscores our approach to sustainable and inclusive growth and is aligned to the 2030 Development Agenda. A core element of the global indicator framework is the disaggregation of data and the coverage of particular groups of the population in order to fulfil the main principle of “Leaving no one behind”. MICS6 presented a unique opportunity to support this process. The Tonga MICS 2019 survey provides 174 indicators for children and women of which 35 indicators are global SDG indicators.

A Commitment to Action: National and International Reporting Responsibilities

More than two decades ago, the **Plan of Action for Implementing the World Declaration on the Survival, Protection and Development of Children in the 1990s** called for:

“Each country should establish appropriate mechanisms for the regular and timely collection, analysis and publication of data required to monitor relevant social indicators relating to the well-being of children Indicators of human development should be periodically reviewed by national leaders and decision makers, as is currently done with indicators of economic development...”

The Multiple Indicator Cluster Surveys programme was developed soon after, in the mid-1990s, to support countries in this endeavour.

Governments that signed the **World Fit for Children Declaration and Plan of Action** also committed themselves to monitoring progress towards the goals and objectives:

“We will monitor regularly at the national level and, where appropriate, at the regional level and assess progress towards the goals and targets of the present Plan of Action at the national, regional and global levels. Accordingly, we will strengthen our national statistical capacity to collect, analyse and disaggregate data, including by sex, age and other relevant factors that may lead to disparities, and support a wide range of child-focused research” (A World Fit for Children, paragraph 60)

Similarly, the **Millennium Declaration** (paragraph 31) called for periodic reporting on progress:

“...We request the General Assembly to review on a regular basis the progress made in implementing the provisions of this Declaration, and ask the Secretary-General to issue periodic reports for consideration by the General Assembly and as a basis for further action.”

The General Assembly Resolution, adopted on 25 September 2015, **“Transforming Our World: the 2030 Agenda for Sustainable Development”** stipulates that for the success of the universal SDG agenda,

“quality, accessible, timely and reliable disaggregated data will be needed to help with the measurement of progress and to ensure that no one is left behind” (paragraph 48); recognizes that “...baseline data for several of the targets remains unavailable...” and calls for “...strengthening data collection and capacity building in Member States...”

Tonga prioritized social protection and human rights with focus on vulnerable groups. To fully inform policy changes and interventions, Tonga has utilized advanced statistical techniques to enable poverty reporting that is inclusive of smaller island communities and developed a robust multidimensional poverty measure that is reliable, valid and contextually appropriate¹.

Tonga continues to honour its commitment to Universal Health Coverage-striving for nationwide coverage and access to quality healthcare services.

Regulations are in place to make early childhood education inclusive for children with disabilities and children from other vulnerable groups. Improvement to effective delivery of sustainable development principles and global citizenships are crucial to learning activities.

The Tonga MICS 2019 has as its primary objectives:

- To provide high quality data for assessing the situation of children, adolescents, women and households in Tonga;
- To furnish data needed for monitoring progress toward national goals, as a basis for future action;
- To collect disaggregated data for the identification of disparities, to inform policies aimed at social inclusion of the most vulnerable;
- To validate data from other sources and the results of focused interventions;
- To generate data on national and global SDG indicators;
- To generate internationally comparable data for the assessment of the progress made in various areas, and to put additional efforts in those areas that require more attention;
- To generate behavioural and attitudinal data not available in other data sources.

This report presents the results of the Tonga MICS 2019. Following Chapter 2 on survey methodology, including sample design and implementation, all indicators covered by the survey, with their definitions, are presented in “Indicators and definitions”. Prior to presenting the survey results, organized into thematic chapters, the coverage of the sample and the main characteristics of respondents including food insecurity experience scale is covered in Chapter 4, “Sample coverage and characteristics of respondents”. From Chapter 5, all survey results are presented in seven thematic chapters. In each chapter, a brief introduction of the topic and the description of all tables, are followed by the tabulations.

Chapter 5 “Survive”, includes findings on under-5 mortality.

This is followed by Chapter 6, “Thrive – Reproductive and maternal health”, which presents findings on fertility, early childbearing, contraception, unmet need, antenatal care, neonatal tetanus, delivery care, birthweight, and post-natal care, HIV, Sexually Transmitted Infections (STIs) and ends with Human Papillomavirus (HPV).

The following chapter, “Thrive – Child health, nutrition and development” presents findings on immunisation, disease episodes, diarrhoea, household energy use, symptoms of acute respiratory infection, infant and young child feeding, malnutrition, salt iodisation, and early childhood development.

Learning is the topic of the next chapter, where survey findings on early childhood education, educational attendance, paternal involvement in children’s education, and foundational learning skills are covered.

¹https://sustainabledevelopment.un.org/content/documents/23588Kingdom_of_Tonga_Voluntary_National_Review_2019_Report_web.pdf.

The next chapter, “Protected from violence and exploitation”, includes survey results on birth registration, child discipline, child labour, child marriage, victimisation, feelings of safety, and attitudes toward domestic violence.

Chapter 10, “Live In a safe and clean environment”, covers the topics of drinking water, handwashing, sanitation, and menstrual hygiene.

Chapter 11 is on equity – titled “Equitable chance in life”, the chapter presents findings on a range of equity related topics, including child functioning, social transfers, discrimination and harassment, and subjective well-being.

The final thematic chapter is on Domestic Violence - the chapter presents the prevalence of physical, sexual and emotional violence against women and girls who are, or ever or were married or even who are or ever have been, living with a man in an intimate relationship. It also presents information is obtained from women on their experience of violence committed by various perpetrators. Information was collected from women age 15-49 years.

The report ends with appendices, with detailed information on sample design, personnel involved in the survey, estimates of sampling errors, data quality, and the questionnaires used.

Children in Maamaloa Vaololoa Kindergarten, Vaha'akolo Road, Vaololoa, Tongatapu in 2018

2 SURVEY METHODOLOGY

2.1 SAMPLE DESIGN

The sample for the Tonga MICS 2019 was designed to provide estimates for a large number of indicators on the situation of children and women at the national level, for urban and rural areas, and for the five divisions: Tongatapu, Vava'u, Ha'apai, 'Eua and Ongi Niua. The urban and rural areas in each of the five divisions were identified as the main sampling strata, and the sample of households was selected in two stages. Within each stratum, a specified number of census enumeration areas (EA) were selected systematically with probability proportional to size. After a household listing was carried out within the selected EAs, a systematic sample of 20 households was drawn in each sample EA. A total of 139 sample EAs and 2,751 sample households were selected at the national level (some of the sampled EA's had less than 20 households). All of the selected EAs were visited during the fieldwork data collection. As the sample is not self-weighting, sample weights are used for reporting survey results. A more detailed description of the sample design can be found in Appendix A: Sample Design.

2.2 QUESTIONNAIRES

Six questionnaires were used in the survey: 1) a household questionnaire to collect basic demographic information on all *de jure* household members (usual residents), the household, and the dwelling; 2) a water quality testing questionnaire administered in 5 households in each cluster of the sample; 3) a questionnaire for individual women administered in each household to all women age 15-49 years; 4) a questionnaire for individual men administered in every second household to all men age 15-49 years; 5) an under-5 questionnaire, administered to mothers (or caretakers) of all children under 5 living in the household; 6) a questionnaire for children age 5-17 years, administered to the mother (or caretaker) of one randomly selected child age 5-17 years living in the household.² The questionnaires included the following modules:

²Children age 15-17 years living without their mother and with no identified caretaker in the household were considered emancipated and the questionnaire for children age 5-17 years was administered directly to them. This slightly reworded questionnaire that only includes the Child's Background, Child Labour and Child Functioning modules is not reproduced in Appendix E.

Household Questionnaire

- List of Household Members
- Education
- Household Characteristics
- Social Transfers
- Household Energy Use
- Food Insecurity Experience
- Water and Sanitation
- Handwashing
- Salt Iodisation

Water Quality Testing Questionnaire

Questionnaire for Individual Women / Men

- Woman's Background^[M]
- Mass Media and ICT^[M]
- Fertility^[M]/Birth History
- Desire for Last Birth
- Maternal and Newborn Health
- Post-natal Health Checks
- Contraception
- Unmet Need
- Attitudes Toward Domestic Violence^[M]
- Victimisation^[M]
- Marriage/Union^[M]
- Adult Functioning^[M]
- Sexual Behaviour^[M]
- HIV/AIDS^[M]
- Human Papillomavirus
- Sexually Transmitted Infections^[M]
- Tobacco and Alcohol Use^[M]
- Domestic Violence
- Life Satisfaction^[M]

Questionnaire for Children Age 5-17 Years

- Child's Background
- Child Labour
- Child Discipline
- Child Functioning
- Parental Involvement
- Foundational Learning Skills

Questionnaire for Children Under 5

- Under-Five's Background
- Birth Registration
- Early Childhood Development
- Child Discipline
- Child Functioning
- Breastfeeding and Dietary Intake
- Immunisation
- Care of Illness
- Anthropometry

^[M] The individual Questionnaire for Men only included those modules indicated.

For all children age 0-2 years with a completed Questionnaire for Children Under Five, the Questionnaire for Vaccination Records at Health Facility, was also used to record vaccinations from the records maintained at health facilities.

In addition to the administration of questionnaires, fieldwork teams tested the salt used for cooking in the households for iodine content, observed the place for handwashing, measured the weights and heights of children age under 5 years, and tested household and source water for *E. coli* levels. Details and findings of these observations and measurements are provided in the respective sections of the report. Further, the questionnaire for children age 5-17 years included a reading and mathematics assessment administered to children age 7-14 years.

The questionnaires were based on the MICS6 standard questionnaires.³ From the MICS6 model English, version, the questionnaires were customised and translated into Tongan Language and were pre-tested in urban (Ma'ufanga and Kolofo'ou) and rural EAs (Lapaha and Kala'au) in Tongatapu in August 2019. Based on the results of the pre-test, modifications were made to the wording and translation of the questionnaires. A copy of the Tonga MICS 2019 questionnaires is provided in Appendix E.

³The standard MICS6 questionnaires can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

2.3 ETHICAL PROTOCOL

The survey protocol was approved by the Education and Training Review Board in October 2019. The protocol included a Protection Protocol which outlines the potential risks during the life cycle of the survey and management strategies to mitigate these.

Verbal consent was obtained for each respondent participating and, for children age 15-17 years individually interviewed, adult consent was obtained in advance of the child's assent. All respondents were informed of the voluntary nature of participation and the confidentiality and anonymity of information. Additionally, respondents were informed of their right to refuse answering all or particular questions, as well as to stop the interview at any time.

2.4 DATA COLLECTION METHOD

MICS surveys utilise Computer-Assisted Personal Interviewing (CAPI). The data collection application was based on the CSPro (Census and Survey Processing System) software, Version 6.3, including a MICS dedicated data management platform. Procedures and standard programs⁴ developed under the global MICS programme were adapted to the Tonga MICS 2019 final questionnaires and used throughout. The CAPI application was tested in urban and rural EAAs in Tongatapu during September 2019. Based on the results of the CAPI-test, modifications were made to the questionnaires and application.

2.5 TRAINING

Training for the fieldwork was conducted from 23 September to 25 October 2019. Training included lectures on interviewing techniques and the contents of the questionnaires, and mock interviews between trainees to gain practice in asking questions. Participants first completed full training on paper questionnaires, followed by training on the CAPI application. The trainees spent 2 days in field practice and one day on a full pilot survey in the Nukualofa area for proximity of providing assistance by staffs while teams are on the ground. The training agenda was based on the template MICS6 training agenda.⁵

Measurers received dedicated training on anthropometric measurements and water quality testing for a total of 10 days, including 2 days in field practice and pilot survey.

Field Supervisors attended additional training on the duties of team supervision and responsibilities.

⁴The standard MICS6 data collection application can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-processing>.

⁵The template training agenda can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

2.6 FIELDWORK

The data were collected by 8 teams; each was comprised of 4 interviewers, one driver, one measurer and a supervisor. Fieldwork began in October 2019 and concluded in December 2019.

Data was collected using tablet computers running the Windows 10 operating system, utilising a Bluetooth application for field operations, enabling transfer of assignments and completed questionnaires between supervisor and interviewer tablets.

2.7 FIELDWORK QUALITY CONTROL MEASURES

Team supervisors were responsible for the daily monitoring of fieldwork. Mandatory re-interviewing was implemented on one household per cluster. Daily observations of interviewer skills and performance was conducted.

During the fieldwork period, each team was visited multiple times by survey management team members and field visits were arranged for UNICEF MICS Team members.

Throughout the fieldwork, field check tables (FCTs) were produced weekly for analysis and action with field teams. The FCTs were customised versions of the standard tables produced by the MICS Programme.⁶

2.8 DATA MANAGEMENT, EDITING AND ANALYSIS

Data were received at the Tonga Statistics Department central office via Internet File Streaming System (IFSS) integrated into the management application on the supervisors' tablets. Whenever logically possible, synchronisation was daily. The central office communicated application updates to field teams through this system.

During data collection and following the completion of fieldwork, data were edited according to editing process described in detail in the Guidelines for Secondary Editing, a customised version of the standard MICS6 documentation.⁷

Data were analysed using the Statistical Package for Social Sciences (SPSS) software, Version 24. Model syntax and tabulation plan developed by UNICEF were customised and used for this purpose.⁸ Tables/results based on less than 25 unweighted cases and background characteristics with not more than two categories to report due to less than 25 unweighted case are not included in this report.

⁶The standard field check tables can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-collection>.

⁷The standard guidelines can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#data-processing>.

⁸The standard tabulation plan and syntax files can be found at: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#analysis>

2.9 DATA SHARING

Unique identifiers such as location and names collected during interviews were removed from datasets to ensure privacy. These anonymised data files are made available on Tonga Statistics Department web location and on the MICS website⁹ and can be freely downloaded for legitimate research purposes. Users are required to submit final research to entities listed in the included readme file, strictly for information purposes.

⁹The survey datasets can be found at: "Surveys." Home - UNICEF MICS. <http://mics.unicef.org/surveys>.

Children in Maamaloa Vaololoa Kindergarten, Vaha'akolo Road, Vaololoa, Tongatapu in 2018

3 INDICATORS AND DEFINITIONS

MICS INDICATOR	SDG ¹⁰	Module ¹¹	Definition ¹²	Value [*]
SAMPLE COVERAGE AND CHARACTERISTICS OF THE RESPONDENTS				
SR.1	Access to electricity	7.1.1	HC	Percentage of household members with access to electricity
SR.2	Literacy rate (age 15-24 years)	WB	Percentage of women and men age 15-24 years who are able to read a short simple statement about everyday life or who attended secondary or higher education Women Men	98.4 99.7 99.4
SR.3	Exposure to mass media	MT	Percentage of women and men age 15-49 years who, at least once a week, read a newspaper or magazine, listen to the radio, and watch television Women Men	14.3 20.5
SR.4	Households with a radio	HC	Percentage of households that have a radio	72.7
SR.5	Households with a television	HC	Percentage of households that have a television	69.6
SR.6	Households with a telephone	HC – MT	Percentage of households that have a telephone (fixed line or mobile phone)	98.3
SR.7	Households with a computer	HC	Percentage of households that have a computer	49.2

¹⁰Sustainable Development Goal (SDG) Indicators, <http://unstats.un.org/sdgs/indicators/indicators-list/>. The Inter-agency Working Group on SDG Indicators is continuously updating the metadata of many SDG indicators and changes are being made to the list of SDG indicators. MICS covers many SDG indicators with an exact match of their definitions, while some indicators are only partially covered by MICS. The latter cases are included here as long as the current international methodology allows for only the way that the MICS indicator is defined, and/or a significant part of the SDG indicator can be generated by the MICS indicator. For more information on the metadata of the SDG indicators, see <http://unstats.un.org/sdgs/metadata/>.

¹¹Some indicators are constructed by using questions in several modules in the MICS questionnaires. In such cases, only the module(s) which contains most of the necessary information is indicated.

¹²All MICS indicators are or can be disaggregated, where relevant, by wealth quintiles, sex, age, ethnicity, migratory status, disability and geographic location (as per the reporting domains), or other characteristics, as recommended by the Inter-agency Expert Group on SDG Indicators: <http://unstats.un.org/sdgs/indicators/Official%20List%20of%20Proposed%20SDG%20Indicators.pdf>

*() Figures that are based on 25-49 unweighted cases

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TM.12 Post-partum stay in health facility		PN	Percentage of women age 15-49 years with a live birth in the last 2 years and delivered the most recent live birth in a health facility who stayed in the health facility for 12 hours or more after the delivery	90.8
TM.13 Post-natal health check for the newborn		PN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery	98.0
TM.14 Newborns dried		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was dried after birth	58.5
TM.15 Skin-to-skin care		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was placed on the mother's bare chest after birth	47.0
TM.16 Delayed bathing		MN	Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was first bathed more than 24 hours after birth	15.1
TM.19 Post-natal signal care functions ⁴		PN	Percentage of women age 15-49 years with a live birth in the last 2 years for whom the most recent live-born child received a least 2 post-natal signal care functions within 2 days of birth	95.8
TM.20 Post-natal health check for the mother		PN	Percentage of women age 15-49 years with a live birth in the last 2 years who received a health check while in facility or at home following delivery, or a post-natal care visit within 2 days after delivery of their most recent live birth	94.6
TM.22 Multiple sexual partnerships		SB	Percentage of women and men age 15-49 years who had sex with more than one partner in the last 12 months Women Men	0.8 3.3
TM.23 Condom use at last sex among people with multiple sexual partnerships		SB	Percentage of men age 15-49 years reporting having had more than one sexual partner in the last 12 months who reported that a condom was used the last time they had sex	12.3
TM.24 Sex before age 15 among young people		SB	Percentage of women and men age 15-24 years who had sex before age 15 Women Men	0.6 0.6
TM.25 Young people who have never had sex		SB	Percentage of never married women and men age 15-24 years who have never had sex Women Men	92.8 77.6
TM.26 Age-mixing among sexual partners		SB	Percentage of women age 15-24 years reporting having had sex in the last 12 months who had a partner 10 or more years older	9.6

¹Signal functions are 1) Checking the cord, 2) Counseling on danger signs, 3) Assessing temperature, 4) Observing/counseling on breastfeeding, and 5) Weighing the baby (where applicable).

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TM.27 Sex with non-regular partners		SB	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months who had a non-marital, non-cohabitating partner	24.9 70.6
TM.28 Condom use with non-regular partners		SB	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months with a non-marital, non-cohabitating partner who reported that a condom was used the last time they had sex	(14.7) 25.4
TM.29 Comprehensive knowledge about HIV prevention among young people		HA	Percentage of women and men age 15-24 years who correctly identify the two ways of preventing the sexual transmission of HIV ¹⁷ , who know that a healthy-looking person can be HIV positive and who reject the two most common misconceptions about HIV transmission	5.6 10.1
TM.30 Knowledge of mother-to-child transmission of HIV		HA	Percentage of women and men age 15-49 years who correctly identify all three means ¹⁸ of mother-to-child transmission of HIV	38.1 34.5
TM.31 Discriminatory attitudes towards people living with HIV		HA	Percentage of women and men age 15-49 years reporting having heard of HIV who report discriminatory attitudes ¹⁹ toward people living with HIV	90.4 87.3
TM.32 People who know where to be tested for HIV		HA	Percentage of women and men age 15-49 years who state knowledge of a place to be tested for HIV	50.3 56.2

¹⁷Using condoms and limiting sex to one faithful, uninfected partner¹⁸Transmission during pregnancy, during delivery, and by breastfeeding¹⁹Respondents who answered no to either of the following two questions: 1) Would you buy fresh vegetables from a shopkeeper or vendor if you knew that this person had HIV? 2) Do you think children living with HIV should be able to attend school with children who are HIV negative?

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TM.33 People who have been tested for HIV and know the results		HA	Percentage of women and men age 15-49 years who report having been tested for HIV in the last 12 months and know their results Women Men	3.4 3.6
TM.34 Sexually active young people who have been tested for HIV and know the results		HA	Percentage of women and men age 15-24 years reporting having had sex in the last 12 months, who have been tested for HIV in the last 12 months and know their results Women Men	8.2 3.7
TM.35a HIV counselling during antenatal care TM.35b HIV testing during antenatal care		HA	Percentage of women age 15-49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit received (a) counselling on HIV ²⁰ (b) information or counselling on HIV after receiving the HIV test results HA	31.5 15.2
TM.36 HIV testing during antenatal care		HA	Percentage of women age 15-49 years with a live birth in the last 2 years who received antenatal care at least once by skilled health personnel during the pregnancy of the most recent live birth and during an ANC visit were offered and accepted an HIV test and received test results	19.7
TM.S1a Self-reported prevalence of Sexual Transmitted Infections (STI) and symptoms TM.S1b TM.S1c TM.S1d		STI	Percentage reporting having STI and/or symptoms of a STI in the past 12 months, among women and men age 15-49 Women (a) STI (b) Bad-smelling/abnormal genital discharge (c) Genital sore or ulcer (d) STI/genital discharge/ sore or ulcer Men (a) STI	1.0 9.3 1.6 10.8 0.7

²⁰Someone talked with the respondent about all three of the following topics: 1) Babies getting the HIV from their mother, 2) preventing HIV and 3) getting tested for HIV

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
THRIVE - CHILD HEALTH, NUTRITION AND DEVELOPMENT				
TC.1		IM	Percentage of children age 12-23 months who received BCG containing vaccine at any time before the survey	98.0
TC.2		IM	Percentage of children age 12-23 months who received at least one dose of Inactivated Polio Vaccine (IPV) and the third/fourth dose of either IPV or Oral Polio Vaccine (OPV) vaccines at any time before the survey	90.7
TC.3		IM	Percentage of children age 12-23 months who received the third dose of DTP containing vaccine (DTP3) at any time before the survey	93.5
TC.4		IM	Percentage of children age 12-23 months who received the third/fourth dose of Hepatitis B containing vaccine (HepB3) at any time before the survey	93.5
TC.5		IM	Percentage of children age 12-23 months who received the third dose of Hib containing vaccine (Hib3) at any time before the survey	93.5
TC.8		IM	Percentage of children age 12-23 months who received rubella containing vaccine at any time before the survey	88.0
TC.10		IM	Percentage of children age 24-35 months who received the second measles containing vaccine at any time before the survey	80.8
Percentage of children who at age				
TC.11a		IM	a) 12-23 months had received all basic vaccinations at any time before the survey b) 24-35 months had received all vaccinations recommended in the national immunization schedule	93.5 77.4
TC.12		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	83.9
TC.13a		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received	63.0 2.6
TC.13b		CA	a) ORS b) ORS and zinc	
TC.14		CA	Percentage of children under age 5 with diarrhoea in the last 2 weeks who received ORT (ORS packet), pre-packaged ORS fluid, recommended homemade fluid or increased fluids and continued feeding during the episode of diarrhoea	66.6
TC.15		EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking (living in households that reported cooking)	84.2

¹Basic vaccinations include: BCG, 3 doses of polio, 3 doses of DTP and 1 dose of measles vaccination. All vaccinations include all doses of vaccinations recommended for children under age 2 years in the national schedule.

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TC.17 Primary reliance on clean fuels and technologies for lighting		EU	Percentage of household members with primary reliance on clean fuels and technologies for lighting (living in households that reported the use of lighting)	99.0
TC.18 Primary reliance on clean fuels and technologies for cooking, space heating and lighting	7.1.2	EU	Percentage of household members with primary reliance on clean fuels and technologies for cooking and lighting ²²	83.7
TC.26 Care-seeking for fever	CA		Percentage of children under age 5 with fever in the last 2 weeks for whom advice or treatment was sought from a health facility or provider	81.6
TC.30 Children ever breastfed	MN		Percentage of most recent live-born children to women with a live birth in the last 2 years who were ever breastfed	91.5
TC.31 Early initiation of breastfeeding	MN		Percentage of infants under 6 months of age who were put to the breast within one hour of birth	38.5
TC.32 Exclusive breastfeeding under 6 months	BD		Percentage of infants under 6 months of age who are exclusively breastfed ²³	39.6
TC.33 Predominant breastfeeding under 6 months	BD		Percentage of infants under 6 months of age who received breast milk as the predominant source of nourishment ²⁴	45.0
TC.34 Continued breastfeeding at 1 year	BD		Percentage of children age 12-15 months who received breast milk during the previous day	52.6
TC.35 Continued breastfeeding at 2 years	BD		Percentage of children age 20-23 months who received breast milk during the previous day	32.8
TC.36 Duration of breastfeeding	BD		The age in months when 50 percent of children age 0-35 months did not receive breast milk during the previous day	13.3
TC.37 Age-appropriate breastfeeding	BD		Percentage of children age 0-23 months appropriately fed ²⁵ during the previous day	40.6

²²Household members living in households that report no cooking, no space heating, or no lighting are not excluded from the numerator²³Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines²⁴Infants who receive breast milk and certain fluids (water and water-based drinks, fruit juice, ritual fluids, oral rehydration solution, drops, vitamins, minerals, and medicines), but do not receive anything else (in particular, non-human milk and food-based fluids)²⁵Infants age 0-5 months who are exclusively breastfed, and children age 6-23 months who are breastfed and ate solid, semi-solid or soft foods

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TC.38 Introduction of solid, semi-solid or soft foods		BD	Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	90.6
TC.39a Minimum acceptable diet		BD	Percentage of children age 6-23 months who had at least the minimum dietary diversity and the minimum meal frequency during the previous day	24.3
TC.39b			(a) breastfed children (b) non-breastfed children	29.6
TC.40 Milk feeding frequency for non-breastfed children		BD	Percentage of non-breastfed children age 6-23 months who received at least 2 milk feedings during the previous day	58.0
TC.41 Minimum dietary diversity		BD	Percentage of children age 6-23 months who received foods from 5 or more food groups ²⁶ during the previous day	53.5
TC.42 Minimum meal frequency		BD	Percentage of children age 6-23 months who received solid, semi-solid and soft foods [plus milk feeds for non-breastfed children] the minimum number of times ²⁷ or more during the previous day	51.2
TC.43 Bottle feeding		BD	Percentage of children age 0-23 months who were fed with a bottle during the previous day	64.8
TC.44a Underweight prevalence		AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe)	0.8
TC.44b			of the median weight for age of the WHO standard	0.3
TC.45a Stunting prevalence	2.2.1	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) below minus three standard deviations (severe)	2.2
TC.45b			of the median height for age of the WHO standard	1.0
TC.46a Wasting prevalence	2.2.2	AN	Percentage of children under age 5 who fall below (a) minus two standard deviations (moderate and severe) (b) minus three standard deviations (severe)	1.1
TC.46b			of the median weight for height of the WHO standard	0.4

²⁶The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

²⁷Breastfeeding children: Solid, semi-solid, or soft foods, two times for infants age 6-8 months, and three times for children 9-23 months; Non-breastfeeding children: Solid, semi-solid, or soft foods, or milk feeds, four times for children age 6-23 months

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
TC.47a Overweight prevalence	2.2.2	AN	Percentage of children under age 5 who are above (a) two standard deviations (moderate and severe) (b) three standard deviations (severe)	11.2 3.1
TC.47b Iodized salt consumption		SA	Percentage of households with salt testing positive for any iodide/iodate among households in which salt was tested or where there was no salt	52.9
TC.48 Early stimulation and responsive care		EC	Percentage of children age 24-59 months engaged in four or more activities to provide early stimulation and responsive care in the last 3 days with (a) Any adult household member (b) Father (c) Mother	87.9 26.5 66.7
TC.49a Availability of children's books		EC	Percentage of children under age 5 who have three or more children's books	24.4
TC.49b TC.49c Inadequate supervision		EC	Percentage of children under age 5 who play with two or more types of playthings	62.9
TC.50 Availability of playthings		EC	Percentage of children under age 5 left alone or under the supervision of another child younger than 10 years of age for more than one hour at least once in the last week	8.6
TC.51 Inadequate supervision	4.2.1	EC	Percentage of children age 36-59 months who are developmentally on track in at least three of the following four domains: literacy-numeracy, physical, social-emotional, and learning	78.6

MICS INDICATOR	SDG ¹	Module ²	Description ³	Value
LEARN				
LN.1 Attendance to early childhood education		UB	Percentage of children age 36-59 months who are attending an early childhood education programme	35.3
LN.2 Participation rate in organised learning (adjusted)	4.2.2	ED	Percentage of children in the relevant age group (one year before the official primary school entry age) who are attending an early childhood education programme or primary school	96.7
LN.3 School readiness		ED	Percentage of children attending the first grade of primary school who attended early childhood education programme during the previous school year	48.8
LN.4 Net intake rate in primary education		ED	Percentage of children of school-entry age who enter the first grade of primary school	78.5
LN.5a LN.5b Net attendance ratio (adjusted)		ED	Percentage of children of primary school age currently attending primary or secondary school	96.4
LN.5c			(a) lower secondary school age currently attending lower secondary school or higher	89.3
			(b) upper secondary school age currently attending upper secondary school or higher	64.5
LN.6a LN.6b Out-of-school rate		ED	Percentage of children of primary school age who are not attending early childhood education, primary or lower secondary school or lower secondary school age who are not attending primary school, lower or upper secondary school or upper secondary school age who are not attending primary school, lower or upper secondary school or higher	3.5
LN.6c			(b) higher	7.8
			(c) upper secondary school age who are not attending primary school, lower or upper secondary school or higher	32.1
LN.7a LN.7b Gross intake rate to the last grade		ED	Rate of children attending the last grade for the first time to children at appropriate age to the last grade	106.5
			(a) Primary school	94.3
			(b) Lower secondary school	
LN.8a LN.8b LN.8c Completion rate	4.1.2	ED	Percentage of children age 3-5 years above the intended age for the last grade who have completed that grade	98.2
			(a) Primary school	91.9
			(b) Lower secondary school	44.1
			(c) Upper secondary school	
LN.9 Effective transition rate to lower secondary school		ED	Percentage of children attending the last grade of primary school during the previous school year who are not repeating the last grade of primary school and in the first grade of lower secondary school during the current school year	96.8
LN.10a LN.10b Over-age for grade		ED	Percentage of students attending in each grade who are 2 or more years older than the official school age for grade	0.2
			(a) Primary school	0.4
			(b) Lower secondary school

4 SAMPLE COVERAGE AND CHARACTERISTICS OF RESPONDENTS

4.1 RESULTS OF INTERVIEWS

Table SR.1.1 presents results of the sample implementation, including response rates. Of 2,751 households selected for the sample, 2,543 were found occupied. Of these, 2,498 were successfully interviewed for a household response rate of 98.2 percent.

The Water Quality Testing Questionnaire was administered to 628 randomly selected households. Of these, 613 were successfully tested for household drinking water, yielding a response rate of 97.6 percent. Also, 543 were successfully tested for source drinking water quality, yielding a response rate of 86.5 percent.

In the interviewed households, 3,157 women (age 15-49 years) were identified. Of these, 2,903 were successfully interviewed, yielding a response rate of 92.0 percent within the interviewed households.

The survey also sampled men (age 15-49) but required only a subsample. All men (age 15-49) were identified in every second household. 2,909 men (age 15-49 years) were listed in the household questionnaires. Questionnaires were completed for 1,232 eligible men, which corresponds to a response rate of 84.8 percent within eligible interviewed households.

There were 1,378 children under age five listed in the household questionnaires. Questionnaires were completed for 1,347 of these children, which corresponds to a response rate of 97.8 percent within interviewed households.

A sub-sample of children age 5-17 years was used to administer the questionnaire for children age 5-17. Only one child has been selected randomly in each household interviewed, and there were 4,055 children age 5-17 years listed in the household questionnaires. Of these, 1,664 children were selected, and questionnaires were completed for 1,628, which corresponds to a response rate of 97.8 percent within the interviewed households.

Overall response rates of 90.3, 83.3, 96.0, 96.1 are calculated for the individual interviews of women, men, under-5s, and children age 5-17 years, respectively.

Table SR.1.1: Results of household, household water quality testing, women's, men's, under-5's and children age 5-17's interviews

Number of households, households selected for water quality testing, women, men, children under 5, and children age 5-17 by interview results, by area of residence and division, Tonga MICS, 2019

4.2 HOUSING AND HOUSEHOLD CHARACTERISTICS

Tables SR.2.1, SR.2.2 and SR.2.3 provide further details on household level characteristics obtained in the Household Questionnaire. Most of the information collected on these housing characteristics have been used in the construction of the wealth index.

Table SR.2.1 presents characteristics of housing, disaggregated by area and division, distributed by whether the dwelling has electricity, energy used for cooking, internet access, the main materials of the flooring, roof, and exterior walls, as well as the number of rooms used for sleeping.

In Table SR.2.2 households are distributed according to ownership of assets by households and by individual household members. This also includes ownership of dwelling.

Table SR.2.3 shows how the household populations in areas and division are distributed according to household wealth quintiles.

Table SR.2.1: Housing characteristics

4.3 HOUSEHOLD COMPOSITION

Tables SR.3.1 provides the distribution of households by selected background characteristics, including the sex of the household head, division, area, number of household members, education and religion of household head, and ethnicity.²⁹ Both unweighted and weighted numbers are presented. Such information is essential for the interpretation of findings presented later in the report and provide background information on the representativeness of the survey sample. The remaining tables in this report are presented only with weighted numbers.³⁰

The presented background characteristics are used in subsequent tables in this report; the figures in the table are also intended to show the numbers of observations by major categories of analysis in the report.

The weighted and unweighted total number of households are equal, since sample weights were normalized. The table also shows the weighted mean household size estimated by the survey.

²⁹This was determined by asking the Tonga MICS questions in Tongan about their ethnic background and religion.

³⁰See Appendix A: Sample design, for more details on sample weights.

Table SR.3.1: Household composition

Percent and frequency distribution of households by selected characteristics, Tonga MICS, 2019

	Weighted percent	Number of households	
		Weighted	Unweighted
Total	100.0	2,498	2,498

75-79	57	0.9	99	1.5	156	1.2
80-84	39	0.6	71	1.1	110	0.8
85+	42	0.6	62	0.9	104	0.8
Child and adult populations						
Children age 0-17 years	2,817	43.4	2,626	38.9	5,443	41.1
Adults age 18+ years	3,669	56.6	4,120	61.1	7,789	58.9

^A As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those found for individuals in tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights.

³¹ The single year age distribution is provided in Table DQ.1.1 in Appendix D: Data quality

4.5 RESPONDENTS' BACKGROUND CHARACTERISTICS

Tables SR.5.1W, SR.5.1M, SR.5.2, and SR.5.3 provide information on the background characteristics of female and male respondents 15-49 years of age, children under age 5 and children age 5-17 years. In all these tables, the total numbers of weighted and unweighted observations are equal, since sample weights have been normalized (standardized).² Note that in Table SR.5.3, an additional column is presented (Weighted total number of children age 5-17 years) to account for the random selection of one child in households with at least one child age 5-17 years. The final weight of each child is the weight of the household multiplied by the number of children age 5-17 years in the household.

In addition to providing useful information on the background characteristics of women, men, children age 5-17, and children under age five, the tables are also intended to show the numbers of observations in each background category. These categories are used in the subsequent tabulations of this report.

Tables SR.5.1W and SR.5.1M provide background characteristics of female and male respondents, age 15-49 years. The tables include information on the distribution of women and men according to area, division, age, education³², marital/union status, motherhood/fatherhood status, health insurance, functional difficulties (for age 18-49), ethnicity and religion of the household head, and wealth index quintiles.^{33,34}

Background characteristics of children age 5-17 and under 5 are presented in Tables SR.5.2 and SR.5.3. These include the distribution of children by several attributes: sex, area, division, age in months, mother's (or caretaker's) education, respondent type, health insurance, functional difficulties (for children under age 5 only for age 2-4 years), ethnicity and religion of the household head and wealth index quintiles.

³²Throughout this report when used as a background variable, unless otherwise stated, "education" refers to highest educational level ever attended by the respondent.

³³The wealth index is a composite indicator of wealth. To construct the wealth index, principal components analysis is performed by using information on the ownership of consumer goods, dwelling characteristics, water and sanitation, and other characteristics that are related to the household's wealth, to generate weights (factor scores) for each of the items used. First, initial factor scores are calculated for the total sample. Then, separate factor scores are calculated for households in urban and rural areas. Finally, the urban and rural factor scores are regressed on the initial factor scores to obtain the combined, final factor scores for the total sample. This is carried out to minimize the urban bias in the wealth index values. Each household in the total sample is then assigned a wealth score based on the assets owned by that household and on the final factor scores obtained as described above. The survey household population is then ranked according to the wealth score of the household they are living in and is finally divided into 5 equal parts (quintiles) from lowest (poorest) to highest (richest). In Tonga MICS, the following assets were used in these calculations:

number of rooms, main material of the dwelling floor, main material of the roof, main material of the exterior wall, fixed telephone line, radio, sofa, bed, table, chair, cupboard, water storage tank, whether household has electricity, television, refrigerator, freezer, washing machine, dvd player, microwave, electric sewing machine, air conditioner, water heater, watch, bicycle, motorcycle, animal-drawn cart, car, truck or van, boat with a motor, generator, solar panel, whether any member has a computer or a tablet, whether any member mobile phone, whether household has access to internet at home, land ownership for agriculture, number of hectares of agricultural land, number of milk cows, other cattle, horses/donkeys, goats, sheep, chickens, pigs, ducks, whether household has bank account, type of cookstove, chimney, chimney with a fan, type of fuel or energy source for cookstove, whether cooking is usually done in house, in separate building or outdoors, source of light in household, main source of drinking water, main source of water used for other purposes such as cooking and handwashing, whether there has been time when the household did not have sufficient quantities of drinking water in the last month prior to the survey, kind of toilet facility, location of toilet, whether the household share toilet facility with others who are not members of household or is open to general public use, total number of households using facility, place of hand washing, presence of water at the place for handwashing, presence of soap or detergent or ash/mud/sand at place for handwashing, place where members often wash their hands, whether relationship to the head is servant.

The wealth index is assumed to capture the underlying long-term wealth through information on the household assets, and is intended to produce a ranking of households by wealth, from poorest to richest. The wealth index does not provide information on absolute poverty, current income or expenditure levels. The wealth scores calculated are applicable for only the particular data set they are based on. Further information on the construction of the wealth index can be found in:

Filmer, D., and L. Pritchett. "Estimating Wealth Effects without Expenditure Data — or Tears: An Application to Educational Enrollments in States of India*." *Demography* 38, no. 1 (2001): 115-32. doi:10.1353/dem.2001.0003;

Rutstein, S. *The DHS Wealth Index: Approaches for Rural and Urban Areas*. Calverton: Macro International, 2008. <https://dhsprogram.com/pubs/pdf/WP60/WP60.pdf>.

³⁴When describing survey results by wealth quintiles, appropriate terminology is used when referring to individual household members, such as for instance "women in the richest population quintile", which is used interchangeably with "women in the wealthiest survey population", "women living in households in the richest population wealth quintile", and similar.

^A In this table and throughout the report, mother's education refers to educational attainment of mothers as well as caretakers of children under 5, who are the respondents to the under-5 questionnaire if the mother is deceased or is living elsewhere.

^B The results of the Child Functioning module are presented in Chapter 11.1.

^C Children age 0-1 years are excluded, as functional difficulties are only collected for age 2-4 years.

^D In this table and throughout the report, mother's functional difficulties refers to functional difficulty of mothers as well as caretakers of children under 5, as mentioned in note A. The category of "No information" applies to mothers or caretakers to whom the Adult Functioning module was not administered. This category is not presented in individual tables. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

^A As one child is randomly selected in each household with at least one child age 5-17 years, the final weight of each child is the weight of the household multiplied with the number of children age 5-17 years in the household. This column is the basis for the weighted percent distribution, i.e. the distribution of all children age 5-17 years in sampled households.

^B In this table and throughout the report where applicable, mother's education refers to educational attainment of mothers as well as caretakers of children age 5-17, who are the respondents to the children age 5-17 questionnaire if the mother is deceased or is living elsewhere. The category of "No information" applies to children age 15-17 years identified as emancipated. This category is not presented in individual tables.

^C Children age 15-17 years were considered emancipated and individually interviewed if not living with his/her mother and the respondent to the Household Questionnaire indicated that the child does not have a primary caretaker.

^D The results of the Child Functioning module is presented in Chapter 11.1.

^E In this table and throughout the report, mother's functional difficulties refers to functional difficulty of mothers as well as caretakers of children age 5-17, as mentioned in note A. The category of "No information" applies to mothers or caretakers to whom the Adult Functioning module was not administered. Emancipated children are also included in this category. This category is not presented in individual tables. Please refer to Tables 8.1W and 8.1M for results of the Adult Functioning module.

4.6 LITERACY

The literacy rate reflects the outcomes of primary education over the previous 30-40 years. As a measure of the effectiveness of the primary education system, it is often seen as a proxy measure of social progress and economic achievement. In MICS, literacy is assessed on the ability of the respondent to read a short simple statement or based on school attendance.

Tables SR.6.1W and SR.6.1M show the survey findings for the total number of interviewed women and men, respectively. The Youth Literacy Rate, MICS Indicator SR.2, is calculated for women and men age 15-24 years and presented in the Age disaggregate in the two tables.

Note that those who have ever attended lower secondary or higher education are immediately classified as literate, due to their education level and are therefore not asked to read the statement. All others who successfully read the statement are also classified as literate. The tables are designed as full distributions of the survey respondents, by level of education ever attended. The total percentage literate presented in the final column is the sum of literate individuals among those with 1) pre-primary or no education, 2) primary education and 3) those with at least some secondary education.

The percent missing includes those for whom no sentence in the required language was available or for whom no response was reported.

¹ MICS indicator SR.2 - Literacy rate (age 15-24 years)

^a Respondents who have attended secondary school or higher are considered literate and are not tested.

() Based on 25-49 unweighted cases.

4.7 MIGRATORY STATUS

The Background module of the Tonga MICS, 2019 asked respondents to the Individual Questionnaire for Women and Men how long they have been continuously living in the current residence and, if they were not living there since birth, whether they lived in a city, town or rural area and the name of the region they lived in before moving to their current place of residence. Tables SR.7.1W and 7.1.M present the percentage of women and men who have changed residence according to the time since last move and also compares the place of residence of each individual at the time of the survey with that of the last place of residence and the type of residence.

Table SR-7.1W: Migratory status (women)

Percent distribution of women age 15-49 years by migratory status and years since last migration, and percent distribution of women who migrated, by type and place of last residence, Tonga MICS, 2019

4.8 ADULT FUNCTIONING

The Adult Functioning module is based on the “short set” of questions developed by the Washington Group on Disability Statistics (WG) – a UN City Group established under the United Nations Statistical Commission. These questions reflect six domains for measuring disability: seeing, hearing, walking, cognition, self-care and communication. This module is recommended for disaggregation of SDG indicators for adults.³⁵

The MICS6 standard questionnaires include these questions in the individual questionnaires as specified previously. For women and men age 18-49, data are obtained directly from the respondents themselves.³⁶

Information at the individual level can also be obtained through a proxy respondent using a roster approach of these questions in the household questionnaire. This would necessitate a single proxy respondent answering on behalf of all adult household members. A proxy respondent can identify a large proportion of difficulties, but tend to under-identify persons with functional difficulties, either deliberately or inadvertently.³⁷

Self-reporting too can have methodological issues. Specifically, a self-reported approach can bias the total sample, as some individuals cannot be interviewed due to their disability (labeled as “incapacitated” in the result code of the individual questionnaires by the interviewers). The number of “incapacitated” individuals identified in household surveys is generally very low (usually not more than 0.5%) and holds both those incapacitated for reasons of disability and those incapacitated for any reason (e.g., sick in bed).

Regardless, to avoid such potential bias, the Adult Functioning data in MICS should not be used to estimate prevalence in the household population age 18-49 years. The standard tabulations of MICS do therefore not include such. These data are however the recommended methodology to allow countries to disaggregate the SDG indicators by disability status – the objective behind the inclusion of the module. It is important to interpret the disaggregate with the bias in mind: The data is representative for the household population age 18-49 for which an interview was completed and functioning difficulty is sometimes the reason for incomplete questionnaires.

The recommendation of the WG is to use a proxy respondent for those individuals who cannot respond for themselves, as this would allow estimation of prevalence in the household population age 18-49 years. This approach is not currently sought by MICS, as the majority of data captured in individual questionnaires cannot be collected through a proxy respondent (e.g. the SDG indicators on fertility, child mortality, family planning, delivery attendance, maternal mortality, early marriage, FGM, etc.).

Tables SR.8.1W and SR.8.1M present the percentage of women and men age 18-49 years with functional difficulties, by domain, and percentage who use assistive devices and have functional difficulty within each domain (Seeing, hearing, walking, self-care, communication, and remembering).

³⁵IAEG-SDG's. Disability Data Disaggregation. Joint Statement by the Disability Sector, Geneva, 2016. <http://www.washingtongroup-disability.com/wp-content/uploads/2016/01/Joint-statement-on-disaggregation-of-data-by-disability-Final.pdf>.

³⁶Note that the Adult Functioning module does not cover adults over age 49 years which is the population most at risk of having a functional limitation due to aging.

^a In MICS, the adult functioning module is asked to individual respondents age 18-49 for the purpose of disaggregation. No information is collected on eligible household members who, for any reason, were unable to complete the interview. It is expected that a significant proportion of the 33 cases of respondents for whom the response code "Incapacitated" was indicated was indeed incapacitated due to functional difficulties. The percentage of women with functional difficulties presented here is therefore not representative of the full measure and should not be used for reporting on prevalence in the population.

^b Column "Percentage of women with difficulties hearing when using hearing aid" was removed because all values are based on fewer than 25 unweighted cases.

(^c) Figures that are based on 25-49 unweighted cases

(^d) Figures that are based on fewer than 25 unweighted cases

4.9 MASS MEDIA AND ICT

The Tonga MICS collected information on exposure to mass media and the use of computers and the internet. Information was collected on exposure to newspapers/magazines, radio and television among women and men age 15-49 years and is presented in Tables SR.9.1W and SR.9.1M.

In Table SR.9.2 presents information on the household ownership of Information and Communication Technology (ICT) equipment (radio, television, fixed telephone line or mobile telephone³⁸ and computer) and access to internet.

Tables SR.9.3W and SR.9.3M present the use of ICT by women and men age 15-49 years based on the information about whether they have ever used computers, mobile phones or internet and during the last three months while tables SR.9.4W and SR.9.4M present the ICT skills of women and men age 15-49 years based on the information about whether they carried out computer related activities in the last three months.

³⁸In addition to the specific question in the Household Questionnaire about whether any member of this household has a mobile phone, households are considered as owning mobile phone if any individual woman (or man) age 15-49 years responded yes to the question about ownership of mobile telephones in the individual questionnaires for women and men age 15-49 years.

Table SR.9.1W: Exposure to mass media (women)

Percentage of women age 15-49 years who are exposed to specific mass media on a weekly basis, Tonga MICS, 2019

	Percentage of women who:					Number of women
	Read a newspaper at least once a week	Listen to the radio at least once a week	Watch television at least once a week	All three media at least once a week ¹	Any media at least once a week

4.10 TOBACCO AND ALCOHOL USE

Tobacco products are products made entirely or partly of leaf tobacco as raw material, which are intended to be smoked, sucked, chewed, or snuffed. All contain the highly addictive psychoactive ingredient, nicotine. Tobacco use is one of the main risk factors for a number of chronic diseases, including cancer, lung diseases, and cardiovascular diseases.³⁹ If mentioned, e-cigarettes are included in the other response category of smokeless tobacco product use.

The consumption of alcohol carries a risk of adverse health and social consequences related to its intoxicating, toxic and dependence-producing properties. In addition to the chronic diseases that may develop in those who drink large amounts of alcohol over a number of years, alcohol use is also associated with an increased risk of acute health conditions, such as injuries, including from traffic accidents.⁴⁰ Alcohol use also causes harm far beyond the physical and psychological health of the drinker. It harms the well-being and health of people around the drinker. An intoxicated person can harm others or put them at risk of traffic accidents or violent behaviour, or negatively affect co-workers, relatives, friends or strangers. Thus, the impact of the harmful use of alcohol reaches deep into society.⁴¹

The Tonga MICS collected information on ever and current use of tobacco and alcohol and intensity of use among women and men age 15-49 years. This section presents the main results.

Table SR.10.1W presents the current and ever use of tobacco products by women age 15-49 years, and Table SR.10.1M presents the corresponding information for men of the same age group.

Tables SR.10.2W and SR.10.2M present results on age at first use of cigarettes, as well as frequency of use, for women and men respectively.

Tables SR.10.3W and SR.10.3M show the use of alcohol among women and men age 15-49 years.

4.11 CHILDREN'S LIVING ARRANGEMENTS

The Convention on the Rights of the Child (CRC) recognizes that “the child, for the full and harmonious development of his or her personality, should grow up in a family environment, in an atmosphere of happiness, love and understanding”. Millions of children around the world grow up without the care of their parents for several reasons, including due to the premature death of the parents or their migration for work. In most cases, these children are cared for by members of their extended families, while in others, children may be living in households other than their own, as live-in domestic workers for instance. Understanding the children’s living arrangements, including the composition of the households in which they live and the relationships with their primary caregivers, is key to design targeted interventions aimed at promoting child’s care and wellbeing.

Table SR.11.1 presents information on the living arrangements and orphanhood status of children under age 18.

The Tonga MICS, 2019 included a simple measure of one particular aspect of migration related to what is termed “children left behind”, i.e. for whom one or both parents have moved abroad. While the amount of literature is growing, the long-term effects of the benefits of remittances versus the potential adverse psycho-social effects are not yet conclusive, as there is somewhat conflicting evidence available as to the effects on children. Table SR.11.2 presents information on the living arrangements and co-residence with parents of children under age 18.

Table SR.11.3 presents information on children under age 18 years not living with a biological parent according to relationship to the head of household and those living in households headed by a family member.

Table SR.11.1: Children's living arrangements and co-residence with parents

Percent distribution of children age 0-17 years according to living arrangements, percentage of children age 0-17 years not living with a biological parent and percentage of children who have one or both parents dead, Tonga MICS, 2019

	Living with neither biological parent				Living with mother only		Living with father only		Missing information on father/mother	Total	Not living with biological mother	Living with neither biological parent ¹	Living with both biological parents ¹	One or both parents dead ²	Number of children age 0-17 years	
	Living with both parents alive	Only father alive	Only mother alive	Both parents alive	Father alive	Father dead	Mother alive	Mother dead

4.12 FOOD INSECURITY EXPERIENCE SCALE

Food security exists when all people, at all times, have physical, social and economic access to sufficient safe and nutritious food that meets their dietary needs and food preferences for an active and healthy life. Food security is recognized as having four main dimensions: availability, access, utilization and stability. The expression “food security” was coined in the 1970s and referred mostly to the adequacy of **country level food supplies**. In the 1980s, it was recognized that hunger could occur in a population even when country level food supplies were adequate. As a result, the focus shifted to looking at the food security problem from the perspective of people’s access to food. The Food Insecurity Experience Scale (FIES) measures **access to food** at household or individual level.⁴²

FIES provides estimates of the proportion of the population facing difficulties in obtaining food of sufficient quality and quantity, based on direct interviews with survey respondents who reply to questions about their own experiences, or on behalf of their households as a whole. Prevalence rates can be computed for food insecurity at moderate and severe levels, in a way that makes them comparable across countries.

This is the first time that Tonga has produced data on moderate and severe food insecurity at the national and division levels. The Tonga MICS collected information on food insecurity using standard FIES module composed of eight questions (items) at the household level with a 12-month reference period.

As the FIES module has been added to the MICS Household Questionnaire, if cases collected are weighted by household weights only, the results would represent the prevalence of food insecure households. Additional calculations were necessary to arrive at the prevalence estimate required for reporting SDG 2.1.2; to produce the distribution of individuals across raw scores, household sampling weights were multiplied by household size. This was done to ensure that resulting prevalence rates are expressed in terms of the national population.⁴³

⁴²<http://www.fao.org/in-action/voices-of-the-hungry>

⁴³Official statistical software of the FAO Voices of the Hungry (VoH) project, R was adapted as a plug-in for the Statistical Package for Social Sciences (SPSS) software primarily used for data analysis in Tonga MICS 2019, as described in SFR chapter on methodology. To estimate food insecurity prevalence, single Rasch model was used to produce both national and disaggregated results (Area, Division, Education of household head and Wealth Quintiles) presented in Tonga MICS. As per FAO FIES methodology, two out of eight FIES module items (WORRIED and RUNOUT) were treated as “unique”.

¹ MICS Indicator FE.1 - Prevalence of moderate or severe food insecurity in the population; SDG Indicator 2.1.2

Maamaloa Vaololoa Kindergarten, Vaha'akolo Road, Vaololoa, Tongatapu after Cyclone Gita in 2018

With the SDG target (3.2) for child mortality, on ending preventable deaths of newborns and children under 5 years of age, the international community has retained the overarching goal of reducing child mortality. While the global target calls for reducing neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births, reduction of child mortality continues to be one of the most important objectives in national plans and programmes in each and every country.

Mortality rates presented in this chapter are calculated from information collected in the birth histories of the Women's Questionnaires. All interviewed women were asked whether they had ever given birth, and those who had were asked to report the number of sons and daughters who live with them, the number who live elsewhere, and the number who have died. In addition, women were asked to provide detailed information on their live births, starting with the firstborn, in chronological order. This information included whether births were single or multiple, and for each live birth, sex, date of birth (month and year), and survival status. Further, for children alive at the time of survey, women were asked the current age of the child; for deceased children, the age at death was obtained. Childhood mortality rates are expressed by conventional age categories and are defined as follows:

- Neonatal mortality (NN): probability of dying within the first month of life⁴⁴
- Post-neonatal mortality (PNN): difference between infant and neonatal mortality rates
- Infant mortality (1q0): probability of dying between birth and the first birthday
- Child mortality (4q1): probability of dying between the first and the fifth birthdays
- Under-five mortality (5q0): the probability of dying between birth and the fifth birthday

Neonatal, infant and under-five mortality rates are expressed as deaths per 1,000 live births. Child mortality is expressed as deaths per 1,000 children surviving to age one. Post-neonatal mortality is calculated as the difference between infant and neonatal mortality rates.

Table CS.1 presents neonatal, post-neonatal, infant, child, and under-five mortality rates for the two most recent ten-year periods before the survey. For each mortality rate in the table, it is possible to assess changes over time, during the last 20 years preceding the survey.

Tables CS.2 and CS.3 provide estimates of child mortality by socioeconomic and demographic characteristics. Using the rates calculated for the 10-year period immediately preceding the survey, differentials in mortality rates by socioeconomic characteristics, such as division, mother's education and wealth, and by demographic characteristics such as sex and mother's age at birth are presented.

⁴⁴The neonatal period is the first 28 days of life, however, traditionally the neonatal mortality rates are computed based on the first month of life in household surveys, which very closely approximates the 28-day definition.

Figure CS.1 compares the findings of this survey on under-5 mortality rates, with those from other data sources. Further qualification and analysis of the consistency and discrepancies of the findings of MICS with other data sources needs to be taken up in a more detailed and separate analysis.

Figure CS.1: Trends in under-5 mortality rates, Tonga

Note: The source data used in the above graph is taken from the final reports of Tonga MICS 2019, and DHS 2012, with the exception of IGME which is downloaded from the UN IGME web portal. Child mortality source data and child mortality estimates are published on www.childmortality.org, the web portal of the United Nations Inter-Agency Group for Child Mortality Estimation (UN IGME). Data from the same source may differ between a report and UN IGME web portal as UN IGME recalculates estimates using smaller intervals and/or calendar years (if data are available).

6 THRIVE – REPRODUCTIVE AND MATERNAL HEALTH

6.1 FERTILITY

Measures of current fertility are presented in Table TM.1.1 for the five-year period preceding the survey. A five-year period was chosen for calculating these rates to provide recent information, while also allowing the rates to be calculated for a sufficient number of cases so as not to compromise the statistical precision of the estimates. The current fertility measures, presented in the table by urban and rural residence, are as follows:

- Age-specific fertility rates (ASFRs), expressed as the number of births per 1,000 women in a specified age group, show the age pattern of fertility. Numerators for ASFRs are calculated by identifying live births that occurred in the five-year period preceding the survey, classified according to the age of the mother (in five-year age groups) at the time of the child's birth. Denominators of the rates represent the number of woman-years lived by all interviewed women (or in simplified terms, the average number of women) in each of the five-year age groups during the specified period.
- The total fertility rate (TFR) is a synthetic measure that denotes the number of live births a woman would have if she were subject to the current age-specific fertility rates throughout her reproductive years (15-49 years).
- The general fertility rate (GFR) is the number of live births occurring during the specified period per 1,000 women age 15-49.
- The crude birth rate (CBR) is the number of live births per 1,000 household population during the specified period.

Table TM.1.1: Fertility rates

Adolescent birth rate, age-specific and total fertility rates, the general fertility rate, and the crude birth rate for the five-year period preceding the survey, by area of residence, Tonga MICS, 2019

CBR ^D	21.6	22.5	22.3

¹ MICS indicator TM.1 - Adolescent birth rate (age 15-19 years); SDG indicator 3.7.2

^A The age-specific fertility rates (ASFR) are the number of live births in the last five years, divided by the average number of women in that age group during the same period, expressed per 1,000 women. The age-specific fertility rate for women age 15-19 years is also termed as the adolescent birth rate

^B TFR: The Total Fertility Rate is the sum of age-specific fertility rates of women age 15-49 years. The TFR denotes the average number of children to which a woman will have given birth by the end of her reproductive years (by age 50) if current fertility rates prevailed. The rate is expressed per woman age 15-49 years

^C GFR: The General Fertility Rate is the number of births in the last 5 years divided by the average number of women age 15-49 years during the same period, expressed per 1,000 women age 15-49 years

^D CBR: The Crude Birth Rate is the number of births in the last 5 years, divided by the total population during the same period, expressed per 1,000 population

6.2 EARLY CHILDBEARING

Table TM.2.1 presents the survey findings on adolescent birth rates and further disaggregates of the total fertility rate.

The adolescent birth rate (age-specific fertility rate for women age 15-19) is defined as the number of births to women age 15-19 years during the five-year period preceding the survey, divided by the average number of women age 15-19 (number of women-years lived between ages 15 through 19, inclusive) during the same period, expressed per 1,000 women.

The adolescent birth rate is a Global SDG indicator (3.7.2) for ensuring universal access to sexual and reproductive health-care services (Target 3.7).

Tables TM.2.2W and TM.2.2M present a selection of early childbearing and fatherhood indicators for young women and men age 15-19 and 20-24 years. In Table TM.2.2W, percentages among women age 15-19 who have had a live birth and those who are pregnant with their first child are presented. For the same age group, the table also presents the percentage of women who have had a live birth before age 15. These estimates are all derived from the detailed birth histories of women.

To estimate the proportion of women who have had a live birth before age 18 – when they were still children themselves – data based on women age 20-24 years at the time of survey are used to avoid truncation⁴⁵.

Table TM.2.2M presents findings on early fatherhood. Percentages among men age 15-19 and 20-24 years who became fathers before ages 15 and 18, respectively, show the extent to which men are becoming fathers when they are still children.

Tables TM.2.3W and TM.2.3M are designed to look at trends in early childbearing for women and early fatherhood for men, by presenting percentages of women and men who became mother and fathers before ages 15 and 18, for successive age cohorts. The table is designed to capture trends in urban and rural areas separately.

⁴⁵Using women age 15-19 to estimate the percentage who had given birth before age 18 would introduce truncation to the estimates, since the majority of women in this age group will not have completed age 18, and therefore will not have completed exposure to childbearing before age 18. The age group 20-24 is used to estimate the percentage of women giving birth before age 18, since all women in this age group have completed exposure to childbearing at very early ages.

6.3 CONTRACEPTION

Appropriate contraceptive use is important to the health of women and children by: 1) preventing pregnancies that are too early or too late; 2) extending the period between births; and 3) limiting the total number of children.⁴⁶

Table TM.3.1 presents the current use of contraception for women who are currently married or in union.⁴⁷ In Table TM.3.1, use of specific methods of contraception are first presented; specific methods are then grouped into modern and traditional methods and presented as such. For sexually active women who are not currently married or in union.

Unmet need for contraception refers to fecund women who are not using any method of contraception, but who wish to postpone the next birth (spacing) or who wish to stop childbearing altogether (limiting). Unmet need is identified in MICS by using a set of questions eliciting current behaviours and preferences pertaining to contraceptive use, fecundity, and fertility preferences.

Table TM.3.1A refers to use of contraception by different groups of women - all, currently married/in union and sexually active unmarried women, while Table TM.3.1B shows use of contraception by all women.

Table TM.3.3 shows the levels of unmet need and met need for contraception, and the demand for contraception satisfied for women who are currently married or in union. The same table is reproduced in

Unmet need for spacing is defined as the percentage of women who are not using a method of contraception AND

- are i) not pregnant, ii) not post-partum amenorrheic⁴⁸ and iii) fecund⁴⁹ and say they want to wait two or more years for their next birth OR
- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and unsure whether they want another child OR
- are pregnant, and say that pregnancy was mistimed (would have wanted to wait) OR
- are post-partum amenorrheic and say that the birth was mistimed (would have wanted to wait).
- Unmet need for limiting is defined as percentage of women who are married or in union and are not using a method of contraception AND
- are i) not pregnant, ii) not post-partum amenorrheic, and iii) fecund and say they do not want any more children OR

⁴⁶PATH, and United Nations Population Fund. Meeting the Need: Strengthening Family Planning Programs. Seattle: PATH/UNFPA, 2006. https://www.unfpa.org/sites/default/files/resource-pdf/family_planning06.pdf.

⁴⁷Table TM.3.2 providing same information for currently unmarried or not in union is not shown due to less than 25 un-weighted cases.

⁴⁸A woman is post-partum amenorrheic if she had a live birth in last two years and is not currently pregnant, and her menstrual period has not returned since the birth of the last child.

⁴⁹A woman is considered infecund if she is neither pregnant nor post-partum amenorrheic, and (1a) has not had menstruation for at least six months, or (1b) has never menstruated, or (1c) had last menstruation occurring before her last birth, or (1d) is in meno-pause/has had hysterectomy OR
 (2) she declares that she i) has had hysterectomy, ii) has never menstruated, iii) is menopausal or iv) has been trying to get pregnant for at least 2 years without result in response to questions on why she thinks she is not physically able to get pregnant at the time of survey OR
 (3) she declares she cannot get pregnant when asked about desire for future birth OR
 (4) she has not had a birth in the preceding 5 years, is currently not using contraception and is currently married and was continuously married during the last 5 years preceding the survey.

- are pregnant and say they did not want to have a child OR
- are post-partum amenorrhoeic and say that they did not want the birth.

Total unmet need for contraception is the sum of unmet need for spacing and unmet need for limiting.

Met need for limiting includes women who are using (or whose partner is using) a contraceptive method⁵⁰ and who want no more children, are using male or female sterilisation or declare themselves as infecund. Met need for spacing includes women who are using (or whose partner is using) a contraceptive method and who want to have another child or are undecided whether to have another child. Summing the met need for spacing and limiting results in the total met need for contraception.

Using information on contraception and unmet need, the percentage of demand for contraception satisfied is also estimated from the MICS data. The percentage of demand satisfied is defined as the proportion of women who are currently using contraception over the total demand for contraception. The total demand for contraception includes women who currently have an unmet need (for spacing or limiting) plus those who are currently using contraception.

Percentage of demand for family planning satisfied with modern methods is one of the indicators used to track progress toward the Sustainable Development Goal, Target 3.7, on ensuring universal access to sexual and reproductive health-care services, including for family planning, information and education and the integration of reproductive health into national strategies and programmes. While SDG indicator 3.7.1 relates to all women age 15-49 years, it is only reported for women currently married or in union and, therefore, located in Table TM.3.3 alone.

Table 3.4B shows percentage of women age with met and unmet need for contraception, total demand for contraception and percentage with need for contraception who are using a modern method.

Table TM.3.5 refers to women's decision making on contraceptive use, while table TM.3.6 shows reasons for not using of contraception methods.

Table TM.3.7 shows exposure to family planning messages, referring to women who heard a family planning message from a health or family planning worker.

⁵⁰In this chapter, whenever reference is made to the use of a contraceptive by a woman, this includes her partner using a contraceptive method (such as male condom).

Table TM.3.1: Use of contraception (currently married/in union)
 Percentage of women age 15-49 years currently married or in union who are using (or whose partner is using) a contraceptive method, Tonga MICS, 2019
 Percentage of women currently married or in union who are using (or whose partner is using):

6.4 ANTENATAL CARE

The antenatal period presents important opportunities for reaching pregnant women with a number of interventions that may be vital to their health and well-being and that of their infants. For example, antenatal care can be used to inform women and families about risks and symptoms in pregnancy and about the risks of labour and delivery, and therefore it may provide the route for ensuring that pregnant women do, in practice, deliver with the assistance of a skilled health care provider. Antenatal visits also provide an opportunity to supply information on birth spacing, which is recognised as an important factor in improving infant survival.

WHO recommends a minimum of eight antenatal visits based on a review of the effectiveness of different models of antenatal care.⁵¹ WHO guidelines are specific on the content on antenatal care visits, which include:

- Blood pressure measurement
- Urine testing for bacteriuria and proteinuria
- Blood testing to detect syphilis and severe anaemia
- Weight/height measurement (optional).

It is of crucial importance for pregnant women to start attending antenatal care visits as early in pregnancy as possible and ideally have the first visit during the first trimester to prevent and detect pregnancy conditions that could affect both the woman and her baby. Antenatal care should continue throughout the entire pregnancy.

Antenatal care is a tracer indicator of the Reproductive and Maternal Health Dimension of SDG 3.8 Universal Health Coverage. The type of personnel providing antenatal care to women age 15-49 years who gave birth in the two years preceding is presented in Table TM.4.1.

Table TM.4.2 shows the number of antenatal care visits during the pregnancy of their most recent birth within the two years preceding the survey, regardless of provider, by selected characteristics. Table TM.4.2 also provides information about the timing of the first antenatal care visit.

The coverage of key services that pregnant women are expected to receive during antenatal care are shown in Table TM.4.3.

6.5 NEONATAL TETANUS

Tetanus immunisation during pregnancy can be life-saving for both the mother and the infant.⁵² WHO estimated that neonatal tetanus killed more than 31,000 newborn children in 2016 within their first month of life.⁵³

SDG 3.1 aims at reducing by 2030 the global maternal mortality ratio to less than 70 per 100,000 live births. Eliminating maternal tetanus is one of the strategies used to achieve SDG target 3.1.

The strategy for preventing maternal and neonatal tetanus is to ensure that all pregnant women receive at least two doses of tetanus toxoid vaccine. If a woman has not received at least two doses of tetanus toxoid during a particular pregnancy, she (and her newborn) are also considered to be protected against tetanus if the woman:

- Received at least two doses of tetanus toxoid vaccine, the last within the previous 3 years;
- Received at least 3 doses, the last within the previous 5 years;
- Received at least 4 doses, the last within the previous 10 years;
- Received 5 or more doses anytime during her life.⁵⁴

To assess the status of tetanus vaccination coverage, women who had a live birth during the two years before the survey were asked if they had received tetanus toxoid injections during the pregnancy for their most recent birth, and if so, how many. Women who did not receive two or more tetanus toxoid vaccinations during this recent pregnancy were then asked about tetanus toxoid vaccinations they may have previously received. Interviewers also asked women to present their vaccination card on which dates of tetanus toxoid are recorded and referred to information from the cards when available.

Table TM.5.1 shows the protection status from tetanus of women who have had a live birth within the last 2 years.

6.6 DELIVERY CARE

Increasing the proportion of births that are delivered in health facilities is an important factor in reducing the health risks to both the mother and the baby. Proper medical attention and hygienic conditions during delivery can reduce the risks of complications and infection that can cause morbidity and mortality to either the mother or the baby.⁵⁵

Table TM.6.1 presents the percent distribution of women age 15-49 who had a live birth in the two years preceding the survey by place of delivery of the most recent birth, and the percentage of their most recent births delivered in a health facility, according to background characteristics.

About three quarters of all maternal deaths occur due to direct obstetric causes.⁵⁶ The single most critical intervention for safe motherhood is to ensure that a competent health worker with midwifery skills is present at every birth, and, in case of emergency, that there is a referral system in place to provide obstetric care in the right level of facility.¹⁰ The skilled attendant at delivery indicator is used to track progress toward the Sustainable Development Goal 3.1 of reducing maternal mortality and it is SDG indicator 3.1.2.

The MICS included questions to assess the proportion of births attended by a skilled attendant. According to the revised definition, skilled health personnel, as referenced by SDG indicator 3.1.2, are competent maternal and newborn health professionals educated, trained and regulated to national and international standards. They are competent to: facilitate physiological processes during labour to ensure clean and safe birth; and identify and manage or refer women and/or newborns with complications.

Table TM.6.2 presents information on assistance during delivery of the most recent birth in the two years preceding the survey. Table TM.6.2 also shows information on women who delivered by caesarean section (C-section) and provides additional information on the timing of the decision to conduct a C-section (before labour pains began or after) to better assess if such decisions are mostly driven by medical or non-medical reasons.

(2) Figures that are based on fewer than 25 unweighted cases

6.7 BIRTHWEIGHT

Weight at birth is a good indicator not only of a mother's health and nutritional status but also the newborn's chances for survival, growth, long-term health and psychosocial development. Low birth weight (LBW), defined as a birthweight less than 2,500 grams (g) regardless of gestational age, carries a range of grave health and developmental risks for children. LBW babies face a greatly increased risk of dying during their early days with more than 80% of neonatal deaths occurring in LBW newborns; recent evidence also links increased mortality risk through adolescence to LBW. For those who do survive, LBW contributes to a wide range of poor health outcomes including higher risk of stunted linear growth in childhood, and long-term effects into adulthood such as lower IQ and an increased risk of chronic conditions including obesity, diabetes and cardiovascular problems.^{57,58}

Premature birth, being born before 37 weeks gestation, is the primary cause of LBW given that a baby born early has less time to grow and gain weight in utero, especially as much of the foetal weight is gained during the latter part of pregnancy. The other cause of LBW is intrauterine growth restriction which occurs when the foetus does not grow well because of problems with the mother's health and/or nutrition, placental problems, or birth defects. While poor dietary intake and disease during pregnancy can affect birthweight outcome, an intergenerational effect has also been noted with mothers who were themselves LBW having an increased risk of having an LBW offspring.^{59,60,61} Short maternal stature and maternal thinness before pregnancy can increase risk of having an LBW child which can be offset by dietary interventions including micronutrient supplementation.^{62,63} Other factors such as cigarette smoking during pregnancy can increase the risk of LBW, especially among certain age groups.^{64,65}

A major limitation of monitoring LBW globally is the lack of birthweight data for many children, especially in some countries. There is a notable bias among the unweighted, with those born to poorer, less educated, rural mothers being less likely to have a birthweight when compared to their richer, urban counterparts with more highly educated mothers. As the characteristics of the unweighted are related to being LBW, LBW estimates that do not represent these children may be lower than the true value. Furthermore, poor quality of available data with regard to excessive heaping on multiples of 500 g or 100 g exists in the majority of available data from low and middle-income countries and can further bias LBW estimates.⁶⁶ To help overcome some of these limitations, a method was developed to adjust LBW estimates for missing birth weights and heaping on 2,500 g.⁶⁷ This method comprises a single imputation allowing births with missing birthweights to be included in the LBW estimate using data on maternal perception of size at birth, and also moved 25 per cent of data heaped on 2500 g to the LBW category. This was applied to available household survey data and the results were reflected in the UNICEF global LBW database between 2004 and 2017. This computation has been used in earlier rounds of MICS reports.

However, the method of estimating LBW has now been replaced with superior modelling. Currently, this new method is not ready for inclusion in the standard tabulations of MICS. Table TM.7.1 therefore presents only the percentage of children weighed at birth and the crude percentage of LBW among children weighed at birth as reported on available cards or from mother's recall. It should be noted that this crude estimate is likely not representative of the full population (typically an underestimate of true LBW prevalence) and therefore must be interpreted with some caution.

Table TM.7.1: Infants weighed at birth

Percentage of women age 15-49 years with a live birth in the last 2 years whose most recent live-born child was weighed at birth, by source of information, and percentage of those with a recorded or recalled birthweight estimated to have weighed below 2,500 grams at birth, by source of information, Tonga MICS, 2019

	Percentage of live births weighed at birth:			Number of women with a live birth in the last 2 years	Percentage of weighed live births recorded below 2,500 grams (crude low birth-weight) ^b :			Number of women with a live birth in the last 2 years whose most recent live-born child have a recorded or recalled birthweight

^a MICS indicator TM.11 - Infants weighed at birth

^b The indicator includes children that were reported weighed at birth, but with no actual birthweight recorded or recalled

^c The values here are as recorded on card or as reported by respondent. The total crude low birth-weight typically requires adjustment for missing birth-weights, as well as heaping, particularly at exactly 2,500 grams. The results presented here cannot be considered to represent the precise rate of low birth-weight (very likely an underestimate) and therefore not reported as a MICS indicator.

(-) Figures that are based on 25-49 unweighted cases
(*) Figures that are based on fewer than 25 unweighted cases

6.8 POST-NATAL CARE

The time of birth and immediately after is a critical window of opportunity to deliver lifesaving interventions for both the mother and newborn. Across the world, approximately 2.6 million newborns annually die in the first month of life⁶⁸ and the majority of these deaths occur within a day or two of birth⁶⁹, which is also the time when the majority of maternal deaths occur⁷⁰.

The Post-natal Health Checks module includes information on newborns' and mothers' contact with a provider, and specific questions on content of care. Measuring contact alone is important as Post-natal care (PNC) programmes scale up, it is vital to measure the coverage of that scale up and ensure that the platform for providing essential services is in place.

Post-natal care services in Tonga are available in all community health centre and health clinics for mothers and children. Mothers, after delivery are advised to attend and given health check appointments to post-natal clinics at their respective health centre/clinics, six weeks after birth. At the health centres/clinics, nurses give the infant a thorough health check, measure weight and height and give scheduled immunization. Mothers are also checked for blood pressure and blood sugar levels. Mothers receive counselling on breastfeeding, immunization and family planning. They are asked about their health after birth and provided with advice on how to deal with potential health concerns. Prior to mothers and infants leaving health centres/clinics they receive consultations and are scheduled for a next health check appointment. Appointments are scheduled in following intervals: 6 weeks, 10 weeks, 14 weeks and 24 months after birth. In between appointments for 14 weeks and 24 months after birth, health centre/clinic nurses contact mothers to decide whether nurses will visit them in their homes or will mothers visit the health centre/clinic.

Table TM.8.1 presents the percent distribution of women age 15-49 who gave birth in a health facility in the two years preceding the survey by duration of stay in the facility following the delivery, according to background characteristics.

Safe motherhood programmes recommend that all women and newborns receive a health check within two days of delivery.⁷¹ To assess the extent of post-natal care utilisation, women were asked whether they and their newborn received a health check after the delivery, the timing of the first check, and the type of health provider for the woman's most recent birth in the two years preceding the survey.

Table TM.8.2 shows the percentage of newborns born in the last two years who received health checks and

⁶⁸UNICEF, et al. *Levels and Trends in Child Mortality Report 2017*. New York: UNICEF, 2017. https://www.unicef.org/publications/files/Child_Mortality_Report_2017.pdf.

⁶⁹ Lawn, J. et al. "Every Newborn: Progress, Priorities, and Potential beyond Survival." *The Lancet* 384, no. 9938 (2014): 189-205. doi:10.1016/s0140-6736(14)60496-7.

⁷⁰WHO et al. *Trends in Maternal Mortality: 1990-2015*. Geneva: WHO Press, 2015. http://apps.who.int/iris/bitstream/handle/10665/194254/9789241565141_eng.pdf?sequence=1.

⁷¹PNC visits, for mothers and for babies, within two days of delivery, is a WHO recommendation that has been identified as a priority indicator for the Global Strategy for Women's, Children's and Adolescents' Health (2016-2030) and other related global monitoring frameworks like Every Newborn Action Plan and Ending Preventable Maternal Mortality.

post-natal care visits from any health provider after birth. Please note that health checks following birth while in facility or at home refer to checks provided by any health provider regardless of timing (column 1), whereas post-natal care visits refer to a separate visit to check on the health of the newborn and provide preventive care services and therefore do not include health checks following birth while in facility or at home. The indicator Post-natal health checks includes any health check after birth received while in the health facility and at home (column 1), regardless of timing, as well as PNC visits within two days of delivery (columns 2, 3, and 4).

In Table TM.8.3, newborns who received the first PNC visit within one week of birth are distributed by location and type of provider of service. As defined above, a visit does not include a check in the facility or at home following birth.

Essential components of the content of post-natal care include, but are not limited to, thermal and cord care, breastfeeding counselling, assessing the baby's temperature, weighing the baby and counselling the mother on danger signs for newborns. Thermal care and cord care are essential elements of newborn care which contributes to keeping the baby stable and preventing hypothermia. Appropriate cord care is important for preventing life-threatening infections for both mother and baby. Table TM.8.4 presents the percentage of last-born children in the last 2 years who were dried after birth, percentage who were given skin to skin contact and percent distribution of timing of first bath.

Table TM.8.6 presents indicators related to the content of PNC visits, specifically the percent of most recent live births in the last two years for which, within 2 days after birth, i) the umbilical cord was examined, ii) the temperature of the newborn was assessed, iii) breastfeeding counselling was done or breastfeeding observed, iv) the newborn was weighed and v) counselling on danger signs for newborns was done.

Tables TM.8.7 and TM.8.8 present information collected on post-natal health checks and visits of the mother and are identical to Tables TM.8.2 and TM.8.3 that presented the data collected for newborns.

Table TM.8.8 matches Table TM.8.3, but now deals with PNC visits for mothers by location and type of provider. As defined above, a visit does not include a check in the facility or at home following birth.

Table TM.8.9 presents the distribution of women with a live birth in the two years preceding the survey by receipt of health checks or PNC visits within 2 days of birth for the mother and the newborn, thus combining the indicators presented in Tables TM.8.2 and TM.8.7.

¹ MICS Indicator TM.13 - Post-natal health check for the newborn

^A Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).

^B Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the newborn and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note ^A above).

^C Post-natal health checks include any health check performed while in the health facility or at home following birth (see note ^A above), as well as PNC visits (see note ^B above) within two days of delivery.

^D The category of "Missing" in the background characteristic of "Place of delivery" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

¹ MICS Indicator TM.20 - Post-natal health check for the mother

^a Health checks by any health provider following facility births (before discharge from facility) or following home births (before departure of provider from home).

^b Post-natal care visits (PNC) refer to a separate visit by any health provider to check on the health of the mother and provide preventive care services. PNC visits do not include health checks following birth while in facility or at home (see note ^a above).

^c Post-natal health checks include any health check performed while in the health facility or at home following birth (see note ^a above), as well as PNC visits (see note ^b above) within two days of delivery.

^d The category of "Missing" in the background characteristic of "Place of delivery" has been suppressed from the table due to small number of unweighted cases.

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

6.9 SEXUAL BEHAVIOUR

Promoting safer sexual behaviour is critical for reducing the risk of HIV transmission. The consistent use of condoms during sex, especially when non-regular or multiple partners are involved, is particularly important for reducing the spread of HIV. A set of questions was administered to all women and men 15-49 years of age to assess their risk of HIV infection. Tables TM.10.1W and TM.10.1M present the percentage of women and men age 15-49 years who ever had sex, percentage who had sex in the last 12 months, percentage who had sex with more than one partner in the last 12 months, and among those who had sex with multiple partners in the last 12 months, the percentage who used a condom at last sex.

Certain behaviour at a young age may create, increase, or perpetuate risk of exposure to HIV. Such behaviour includes sex at an early age and women having sex with older men.³³ Tables TM.10.2W and 10.2M show the percentage of women age 15-24 years such key sexual behaviour indicators.

³³UNAIDS et al. *Fast-Tracking Combination Prevention - Towards reducing new HIV infections to fewer than 500 000 by 2020*. Geneva: UNAIDS, 2015. http://www.unaids.org/sites/default/files/media_asset/20151019_JC2766_Fast-tracking_combination_prevention.pdf.

¹ MICS Indicator TM.24 - Sex before age 15 among young people² MICS Indicator TM.25 - Young people who have never had sex³ MICS Indicator TM.27 - Sex with non-regular partners⁴ MICS Indicator TM.28 - Condom use with non-regular partners

^a The category of "Missing" in the background characteristic of "Education" and "Marital status" has been suppressed from the table due to small number of unweighted cases.
⁽¹⁾ Figures that are based on 25-49 unweighted cases
⁽²⁾ Figures that are based on fewer than 25 unweighted cases
Note: Figures for column for women age 15-24 years who had sex with more than one partner in the last 12 months has been deleted due to small number of unweighted cases

6.10 HIV

Some of the most important prerequisites for reducing the rate of HIV infection is accurate knowledge of how HIV is transmitted and strategies for preventing transmission.³³ Correct information is the first step towards raising awareness and giving adolescents and young people the tools to protect themselves from infection. Misconceptions about HIV are common and can confuse adolescents and young people and hinder prevention efforts.^{32,33} The UN General Assembly Special Session on HIV/AIDS (UNGASS) called on governments to improve the knowledge and skills of young people to protect themselves from HIV.^{32,33} The HIV module administered to women and men 15-49 years of age addresses part of this call.

The Global AIDS Monitoring (GAM) Reporting indicator: the percentage of young people who have comprehensive and correct knowledge of HIV prevention and transmission, is defined as 1) knowing that consistent use of a condom during sexual intercourse and having just one uninfected faithful partner can reduce the chance of getting HIV, 2) knowing that a healthy-looking person can have HIV, and 3) rejecting the two most common local misconceptions about transmission/prevention of HIV. In the Tonga MICS, 2019 all women and men who have heard of AIDS were asked questions on all three components and the results are detailed in Tables TM.11.1W and TM.11.1M.

Tables TM.11.1W and TM.11.1M also present the percentage of women and men who can correctly identify misconceptions concerning HIV. The indicator is based on the two most common and relevant misconceptions in Tonga, that HIV can be transmitted by mosquito bites and sharing food with someone who someone with HIV. The tables also provide information on whether women and men know that HIV cannot be transmitted by using a condom every time they have sex and having only one faithful uninfected sex partner.

Knowledge of mother-to-child transmission of HIV is also an important first step for women to seek HIV testing when they are pregnant to avoid infection in the baby. Women and men should know that HIV can be transmitted during pregnancy, during delivery, and through breastfeeding. The level of knowledge among women and men age 15-49 years concerning mother-to-child transmission is presented in Tables TM.11.2W and TM.11.2M.

Discrimination is a human rights violation prohibited by international human rights law and most national constitutions. Discrimination in the context of HIV refers to unfair or unjust treatment (an act or an omission) of an individual based on his or her real or perceived HIV status. Discrimination exacerbates risks and deprives people of their rights and entitlements, fuelling the HIV epidemic.³³

The following questions were asked in Tonga MICS 2019 to measure stigma and discriminatory attitudes that may result in discriminatory acts (or omissions): whether the respondent 1) would buy fresh vegetables from a shopkeeper or vendor who has HIV; 2) thinks that children living with HIV should be allowed to attend school with children who do not have HIV; 3) thinks people hesitate to take an HIV test because they are afraid of how other people will react if the test result is positive for HIV; 4) thinks people talk badly about those living with HIV, or who are thought to be living with HIV; 5) thinks people living with HIV, or thought to be living with HIV, lose the respect of other people; 6) agrees or disagrees with the statement ‘I would be ashamed if someone in my family had HIV’; and 7) fears that she/he could get HIV if she/he comes into contact with the saliva of a person living with HIV. Tables TM.11.3W and TM.11.3M present the attitudes of women and men towards people living with HIV.

Another important indicator is the knowledge of where to be tested for HIV and use of such services. In order to

protect themselves and to prevent infecting others, it is important for individuals to know their HIV status. Knowledge of own status is also a critical factor in the decision to seek treatment.^{32,33} Questions related to knowledge of a facility for HIV testing and whether a person has ever been tested are presented in Tables TM.11.4W and TM.11.4M.

Among women who had given birth within the two years preceding the survey, the percentage who received counselling and HIV testing during antenatal care is presented in Table TM.11.5. This indicator is used to track progress towards global and national goals to eliminate mother-to-child transmission of HIV. High coverage enables early initiation of care and treatment for HIV positive mothers required to live healthy and productive lives.

In many countries, over half of new adult HIV infections are among young people age 15-24 years thus a change in behaviour among members of this age group is especially important to reduce new infections.^{32,33} The next tables present specific information on this age group. Tables TM.11.6W and TM.11.6M summarise information on key HIV indicators for young women and young men.

		Percentage who know that HIV can be prevented by:						Percentage who know that HIV cannot be transmitted by:			Percentage who reject the two most common misconceptions and know that a healthy-looking person can be HIV-positive			Percentage with comprehensive knowledge ^{a,b}

^aMICS Indicator TM.29 - Comprehensive knowledge about HIV prevention among young people

^bA comprehensive knowledge about HIV prevention includes those who know of the two ways of HIV prevention (having only one faithful uninfected partner and using a condom every time), who know that a healthy-looking person can be HIV-positive and who reject the two most common misconceptions about HIV transmission

^cThe category of 'Missing' in the background characteristic of 'Education' and 'Marital status' has been suppressed from the table due to small number of unweighted cases.

^dFigures that are based on 25-49 unweighted cases

^eFigures that are based on fewer than 25 unweighted cases

^

2

MICS Indicator TM.34 - Sexually active young people who have been tested for HIV and know the results

a

Refer to Table TM.11.3M for the two components.

b

The category of 'Missing' in the background characteristic of 'Education' and 'Marital status' has been suppressed from the table due to small number of unweighted cases

c

(1) Figures that are based on fewer than 25 unweighted cases

(2) Figures that are based on fewer than 25 unweighted cases

6.11 SEXUALLY TRANSMITTED INFECTIONS (STI)

Sexually transmitted infections (STI) have a profound impact on sexual and reproductive health. Consequences of STIs for reproductive health can be severe and life threatening, with consequences for women being more common and severe than for men.⁷⁵ STIs increase the risk of acquiring or transmitting HIV. The early diagnosis and treatment of STIs is vital to the interruption of transmission of STIs as well as to ensuring the quality of life of those infected.

Tables TM13.1W and TM13.1M present data on the prevalence of sexually transmitted infections (STIs) in women and men age 15–49, who have ever had sexual intercourse. Tables TM13.2W shows percentage of women age 15–49 with STIs or symptoms of STIs who have sought advice or treatment in the past 12 months.

⁷⁵WHO. Report on global sexually transmitted infection surveillance, 2018. Geneva: World Health Organization; 2018. Licence: CC BY-NC-SA 3.0 IGO] <https://www.who.int/reproductivehealth/publications/stis-surveillance-2018/en/>

6.12 HUMAN PAPILLOMA VIRUS

Human Papilloma Virus (HPV) is the most common viral infection of the reproductive tract that can infect anyone who has ever had a sexual encounter. In most cases, the virus is harmless and most people have no symptoms. The body clears most HPV infections naturally. HPV can be contracted from one partner, remain dormant, and then later be unknowingly transmitted to another sexual partner, including a spouse. Though usually harmless, some high-risk types cause cervical cell changes that, if not detected in time, can turn into cancer.

Majority of women with an HPV infection will not develop cervical cancer, but regular Pap and HPV tests are important. HPV infections in women over 30 are less likely to be cleared naturally, so an HPV test can be helpful in letting health care providers know which women are at greatest risk of cervical cancer.⁷⁶ Cervical cancer is preventable if precancerous cell changes are detected and treated early.

HPV vaccination is to be soon introduce to the country so getting a baseline data on the level of awareness that women in reproductive age have on HPV and HPV vaccination is necessary.

Table TM14.1 shows the self-reported prevalence of HPV and/or symptoms of HPV among women age 15–49 by background characteristics. Table TM14.2 shows the percentage of women age 15–49, who reported not wanting to receive HPV vaccine by reasons.

7 THRIVE – CHILD HEALTH, NUTRITION AND DEVELOPMENT

7.1 IMMUNISATION

Immunisation is a proven tool for controlling and eliminating life-threatening infectious diseases and is estimated to avert between 2 and 3 million deaths each year.⁷⁷ It is one of the most cost-effective health investments, with proven strategies that make it accessible to even the most hard-to-reach and vulnerable populations.

The WHO Recommended Routine Immunisations for Children⁷⁸ recommends all children to be vaccinated against tuberculosis, diphtheria, tetanus, pertussis, polio, measles, hepatitis B, haemophilus influenzae type b, pneumococcal bacteria/disease, rotavirus, and rubella.⁷⁹

At the global level, SDG indicator 3.b.1 is used to monitor the progress of the vaccination of children at the national level. The proportions of the target population covered by DTP, pneumococcal (conjugate) and measles are presented in Table TC.1.1.

All doses in the primary series are recommended to be completed before the child's first birthday, although depending on the epidemiology of disease in a country, the first doses of measles and rubella containing vaccines may be recommended at 12 months or later. The recommended number and timing of most other doses also vary slightly with local epidemiology and may include booster doses later in childhood.

The vaccination schedule followed by the Tonga National Immunisation Programme provides all the above mentioned vaccinations with: birth doses of BCG and Hepatitis B vaccines (within 24 hours of birth), three doses of the Pentavalent vaccine containing DTP, Hepatitis B, and Haemophilus influenzae type b (Hib) antigens, three doses of Polio vaccine, and two doses of the MR vaccine containing measles and rubella antigens. All vaccinations should be received during the first year of life except the doses of MR at 12 and 18 months. Taking into consideration this vaccination schedule, the estimates for full immunisation coverage from the Tonga MICS 2019 are based on children age 12-23/24-35 months.

Information on vaccination coverage was collected for all children under three years of age. All mothers or caretakers were asked to provide vaccination cards. If the vaccination card for a child was available, interviewers copied vaccination information from the cards onto the MICS questionnaire. If no vaccination card was available for the child, the interviewer proceeded to ask the mother to recall whether the child had received each of the vaccinations, and, for applicable antigens, how many doses were received. Information was also obtained from vaccination records at health facilities. The final vaccination coverage estimates are based on information obtained from the health facility vaccination records, vaccination card and the mother's report of vaccinations received by the child.

Table TC.1.2 presents vaccination coverage estimates among children age 12-23 and 24-35 months by background characteristics. The figures indicate children receiving the vaccinations at any time up to the date of the survey, and are based on information from both the vaccination cards or health facility records and mothers'/caretakers' reports.

⁷⁷"Immunization Highlights 2015." World Health Organization. June 27, 2016. Accessed August 23, 2018. <http://www.who.int/immunization/highlights/2015/en/>.

⁷⁸"WHO Recommendations for Routine Immunization - Summary Tables." World Health Organization. August 22, 2018. Accessed August 23, 2018. http://www.who.int/immunization/policy/immunization_tables/en/.

⁷⁹Additionally, vaccination against the human papillomavirus (HPV) is recommended for girls from 9 to 14 years of age², but coverage of this vaccine is not yet included in MICS, as methodology is under development.

Table TC.1.1: Vaccinations in the first years of life

³ MICS Indicator TC.3 - Diphtheria, tetanus and pertussis (DTP) immunization coverage; SDG indicator 3.b.1 & 3.8.1

⁴ MICS Indicator TC.4 - Hepatitis B immunization coverage

⁵ MICS Indicator TC.5 - Haemophilus influenzae type B (Hib) immunization coverage

⁶ MICS Indicator TC.8 - Rubella immunization coverage

⁷ MICS Indicator TC.10 - Measles immunization coverage; SDG indicator 3.b.1

^{11a} MICS Indicator TC.11a - Full immunization coverage (basic antigens)

^{12b} MICS Indicator TC.11b - Full immunization coverage (all antigens)

na: not applicable

^A Vaccination card or other documents where the vaccinations are written down

^B MICS indicators TC.1, TC.2, TC.3, TC.4, TC.5, TC.8, and TC.11a refer to children age 12-23 months; MICS indicators TC.10 and TC.11b refer to children age 24-35 months

^C The Hepatitis B birth dose is further disaggregated by timing of dose. For children with vaccination records, 'Within 1 day' includes records of a dose given on the day of birth or the following day. For children relying on mother's report, 'Within 1 day' refers to the 24 hours following birth, as this is specifically used in the recall question. Cases with unknown timing are not shown in the disaggregate, but are included in the total, which therefore may present more cases than the sum of the disaggregate.

^E Basic antigens include: BCG, Polio3, DTP3, HepB3, Hib3, and Measles-Rubella

^F All antigens include: BCG, Polio3/IPV, DTP3, HepB3, Hib3 and Measles-Rubella 2 as per the vaccination schedule in Tonga

7.2 DISEASE EPISODES

A key strategy for achieving progress toward SDG 3.2: By 2,030, end preventable deaths of new-borns and children under 5 years of age, with all countries aiming to reduce neonatal mortality to at least as low as 12 per 1,000 live births and under-5 mortality to at least as low as 25 per 1,000 live births, is to tackle the diseases such as diarrhoea, pneumonia.

Table TC.2.1 presents the percentage of children under 5 years of age who were reported to have had an episode of diarrhoea, symptoms of acute respiratory infection (ARI) or fever during the 2 weeks preceding the survey. These results are not measuring of true prevalence, and should not be used as such, but rather the period-prevalence of those illnesses over a two-week time window.

The definition of a case of diarrhoea or fever, in this survey, was the mother's (or caretaker's) report that the child had such symptoms over the specified period; no other evidence was sought beside the opinion of the mother. A child was considered to have had symptoms of ARI if the mother or caretaker reported that the child had, over the specified period, an illness with a cough with rapid or difficult breathing, and whose symptoms were perceived to be due to a problem in the chest or both a problem in the chest and a blocked or runny nose. While this approach is reasonable in the context of a multi-topic household survey, these basically simple case definitions must be kept in mind when interpreting the results, as well as the potential for reporting and recall biases. Further, diarrhoea, fever and ARI are not only seasonal but are also characterized by the often rapid spread of localized outbreaks from one area to another at different points in time. The timing of the survey and the location of the teams might thus considerably affect the results, which must consequently be interpreted with caution. For these reasons, although the period-prevalence over a two-week time window is reported, these data should not be used to assess the epidemiological characteristics of these diseases but rather to obtain denominators for the indicators related to use of health services and treatment.

Table TC.2.1: Reported disease episodes

Percentage of children age 0-59 months for whom the mother/caretaker reported an episode of diarrhoea, symptoms of acute respiratory infection (ARI), and/or fever in the last two weeks, Tonga MICS, 2019

7.3 HOUSEHOLD ENERGY USE

There is a global consensus and an ever-growing body of evidence that expanding access to clean household energy for cooking, heating, and lighting is key to achieving a range of global priorities such as improving health, gender equality, equitable economic development and environmental protection. Goal 7 of the Sustainable Development Goals seeks to ensure access to affordable, reliable sustainable and modern energy for all by 2,030 and would be measured as the percentage of the population relying on clean fuels and technology.⁸⁰

The Tonga 2,019 MICS included a module with questions to assess the main technologies and fuels used for cooking, heating, and lighting. Information was also collected about the use of technologies with chimneys or other venting mechanisms which can improve indoor air quality through moving a fraction of the pollutants outdoors.

Households that use clean fuels and technologies for cooking are those mainly using electric stove, solar cooker, LPG (Liquefied Petroleum Gas)/cooking gas stove, biogas stove, or a liquid fuel stove burning ethanol/alcohol only. Table TC.4.1 presents the percent distribution of household members according to type of cookstove mainly used by the household and percentage of household members living in households using clean fuels and technologies for cooking.

Table TC.4.2 further presents the percent distribution of household members using polluting fuels and technologies for cooking according to type of cooking fuel mainly used by the household, and percentage of household members living in households using polluting fuels and technologies for cooking while Table TC.4.3 presents the percent distribution of household members in households using polluted fuels for cooking by type and characteristics of cookstove and by place of cooking.

Households that use clean fuels and technologies for lighting are those mainly using electricity, solar lantern, rechargeable or battery powered flashlight, torch or lantern, or biogas lamp. Table TC.4.6 presents the percent distribution of household members according to type of lighting fuel mainly used for lighting by the household, and percentage of household members living in households using clean fuels and technologies for lighting.

The questions asked about cooking and lighting help to monitor SDG indicator 7.1.2, “Proportion of population with primary reliance on clean fuels and technology” for cooking and lighting. Table TC.4.7 presents the percentage of household members living in households using clean fuels and technologies for cooking and lighting.

⁸⁰WHO. Burning Opportunity: Clean Household Energy for Health, Sustainable Development, and Wellbeing of Women and Children. Geneva: WHO Press, 2016. http://apps.who.int/iris/bitstream/handle/10665/204717/9789241565233_eng.pdf;jsessionid=63CEC48ED96098D4256007A76FEB8907?sequence=1.

7.5 INFANT AND YOUNG CHILD FEEDING

Optimal infant and young child feeding practices can increase survival and promote healthy growth and development, particularly during the critical window from birth to 2 years of age.

Breastfeeding in the first few years of life protects children from infection, provides an ideal source of nutrients and is economical and safe. Despite these critical benefits, breastfeeding practices are suboptimal in many parts of the world. Many children do not start breastfeeding early enough, do not breastfeed exclusively for the recommended six months or stop breastfeeding too soon. Mothers often face pressures to switch to infant formula, which can contribute to growth faltering and micronutrient malnutrition. Infant formula and other breastmilk substitutes can also be life-threatening in settings where hygienic conditions and safe drinking water are not readily available. In some cases, it can be unsafe even with proper and hygienic preparation in the home due to food adulteration or other contamination that can affect unaware consumers.⁸³ As children reach the age of 6 months, their consumption of appropriate, adequate and safe complementary foods and continued breastfeeding leads to better health and growth outcomes, with the potential to reduce stunting during the first two years of life.⁸⁴

UNICEF and WHO recommend that infants be: (i) breastfed within one hour of birth; (ii) breastfed exclusively for the first six months of life; and (iii) breastfed for up to 2 years of age and beyond.⁸⁵ Starting at 6 months, breastfeeding should be combined with safe, age-appropriate feeding of solid, semi-solid and soft foods with specific guiding principles available about how the feeding should be done with topics ranging from food consistency to responsive feeding.^{86,87} The breastfeeding recommendations and guiding principles for complementary feeding for which standard indicators^{88,89} have been developed, and which are collected in this survey, are listed in the table below.

Recommendation/ guiding principle	Indicators /proximate measures ⁹⁰	Notes on interpretation ⁹¹	Table
Breastfeed within one hour of birth	Early initiation of breastfeeding Percentage of most recent live-born children to women with a live birth in the last 2 years who were put to the breast within one hour of birth	This is the only indicator in the series based on historical recall, that is, of what happened up to 2 years before the survey interview.	TC 7.1
Breastfeed exclusively for the first six months of life	Exclusive breastfeeding under 6 months Percentage of infants under 6 months of age who are exclusively breastfed ⁹²	Captures the desired practice for the entire population of interest (i.e. all children age 0-5 months should be exclusively breastfed) in a 24-hour period. It does not represent the proportion of infants who are exclusively breastfed every day from birth until they are 6 months of age and should not be interpreted as such.	TC 7.3
Introduce solid, semi-solid and soft foods at the age of 6 months	Introduction of solid, semi-solid or soft foods (age 6-8 months) Percentage of infants age 6-8 months who received solid, semi-solid or soft foods during the previous day	Captures the desired practice for the entire population of interest (i.e. all children age 6-8 months should eat solids) in a 24-hour period. It does not represent the proportion of infants who began receiving solids when they turned 6 months nor the proportion of children age 6-8 months who received solids every day since they turned 6 months of age and should not be interpreted as such.	TC 7.6
Continue frequent, on-demand breastfeeding for two years and beyond	Continued breastfeeding at 1 year and 2 years Percentage of children age 12-15 months (1 year) and 20-23 months (2 years) who received breast milk during the previous day	Captures the desired practice for different populations of interest (children should be breastfed for up to 2 years) in a 24-hour period. However, the label of 1 and 2 years can be confusing given the actual age range in months for each indicator.	TC 7.3
Provide meals with appropriate frequency and energy density	Minimum meal frequency (age 6-23 months) <u>Breastfed children:</u> Depending on age, at least two or three meals/snacks provided during the previous day <u>Non-breastfed children:</u> At least four meals/snacks <u>and/or milk feeds</u> provided during the previous day	This indicator represents the minimum number of meals and not adequacy. In addition, standard questionnaires do not distinguish if milk feeds were provided as part of a solid meal or as a separate meal. Meals may therefore be double counted for some non-breastfed children. Rates should not be compared between breastfed and non-breastfed children.	TC 7.7
Provide foods with appropriate nutrient content	Minimum dietary diversity (age 6-23 months) At least five of eight food groups ⁹³ consumed in the 24 hours preceding the survey	This indicator represents the minimum dietary diversity and not adequacy. In addition, consumption of any amount of food from each food group is sufficient to "count" as the standard indicator is only meant to capture yes/no responses. Rates should not be compared between breastfed and non-breastfed children.	TC 7.7
Provide an appropriate amount of food	No standard indicator exists		na
Provide food with appropriate consistency	No standard indicator exists		na

⁹⁰It should be noted that these indicators are, in general, proximate measures which do not capture the exact recommendations or guidelines, but serve as a basis for monitoring, providing useful information on the population of interest.

⁹¹For all indicators other than early initiation of breastfeeding, the definition is based on current status, that is, what happened during the day before the survey from the time when the child woke up to the time when he/she went to sleep until the morning of the day of the interview.

⁹²Infants receiving breast milk, and not receiving any other fluids or foods, with the exception of oral rehydration solution, vitamins, mineral supplements and medicines.

⁹³The indicator is based on consumption of any amount of food from at least 5 out of the 8 following food groups: 1) Breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables

Recommendation/ guiding principle	Indicators /proximate measures ⁹⁰	Notes on interpretation ⁹¹	Table
Use of vitamin-mineral supplements or fortified products	No standard indicator exists		na
Safe preparation and storage of foods	While it was not possible to develop indicators to fully capture guidance, one indicator does cover part of the principle: Not feeding with a bottle with a nipple		TC.7.8
Responsive feeding	No standard indicator exists		na

In addition to the indicators in the table above, three dimensions of complementary feeding are combined to form a composite indicator of “minimum acceptable diet”. This indicator assesses energy needs and nutrient adequacy (apart from iron). To have a minimum acceptable diet, a child must have received in the previous day:

- (i) The appropriate number of meals/snacks/milk feeds;
- (ii) Food items from at least 5 out of 8 food groups for breastfed children; and 4 out of 7⁹⁴ food groups for non-breastfed children; and
- (iii) At least two milk feeds for non-breastfed children.

Table TC.7.1 is based on mothers' reports of when their last-born child, born in the last two years, was first put to the breast. It indicates the proportion who were ever breastfed, as well as those who were first breastfed within one hour and one day of birth.

Table TC.7.2 presents information about liquids or other items newborns were given in the first 3 days of life, apart from breastmilk. The data are disaggregated by various background characteristics, including whether the child was ever breastfed or not.

The set of infant and young child feeding indicators reported in tables TC.7.3 through TC.7.6 are based on the mother's report of consumption of food and liquids during the day or night prior to being interviewed. Data are subject to a number of limitations, some related to the respondent's ability to provide a full report on the child's liquid and food intake due to recall errors, as well as lack of knowledge in cases where the child was fed by other individuals.

In Table TC.7.3, breastfeeding status is presented for *exclusively breastfed* infants age 0–5 months (i.e. those who receive only breastmilk) and *predominantly breastfed* infants age 0–5 months (i.e. those who receive breastmilk in addition to plain water and/or non-milk liquids). The table also shows continued breastfeeding of children age 12–15 months and age 20–23 months.

⁹⁴Note that the denominator becomes 7 food groups for non-breastfed children in the composite indicator as the milk products group is removed from diet diversity, as this is assessed separately.

Table TC.7.4 shows the median duration of any breastfeeding among children age 0–35 months and the median duration of exclusive breastfeeding and predominant breastfeeding among children age 0–23 months.

The age-appropriateness of breastfeeding practices for children under the age of 24 months is provided in Table TC.7.5. Different feeding criteria are used depending on the age of the child. For infants age 0–5 months, exclusive breastfeeding is considered age-appropriate feeding, while children age 6–23 months are considered appropriately fed if they are receiving breastmilk and solid, semi-solid or soft foods.

Table TC.7.6 further looks into the introduction of solid, semi-solid, or soft foods for infants age 6–8 months, while Table TC.7.7 presents the percentage of children age 6–23 months who received the minimum number and diversity of meals/snacks during the previous day (referring to solid, semi-solid, or soft food, but also milk feeds for non-breastfed children), by breastfeeding status.

The continued practice of bottle-feeding is a concern because of the potential for contamination if the bottle and/or nipple are not properly cleaned or sterilized. Bottle-feeding can also hinder breastfeeding due to nipple confusion, especially at the youngest ages.⁹⁵ Table TC.7.8 presents the percentage of children aged 0–23 months who were bottle-fed with a nipple during the previous day.

⁹⁵Zimmerman, E. and K. Thompson. "Clarifying Nipple confusion." J Perinatol 35, no.11 (2015):895-9. doi: 10.1038/jp.2015.83.

Table TC.7.1: Initial breastfeeding

^f Minimum dietary diversity is defined as receiving foods from at least 5 of 8 food groups: 1) breastmilk, 2) grains, roots and tubers, 3) legumes and nuts, 4) dairy products (milk, infant formula, yogurt, cheese), 5) flesh foods (meat, fish, poultry and liver/organ meats), 6) eggs, 7) vitamin-A rich fruits and vegetables, and 8) other fruits and vegetables.

^g The minimum acceptable diet for non-breastfeeding children age 6-23 months is defined as children who also received solid, semi-solid, or soft foods 2 times or more daily for children age 6-8 months and 3 times or more daily for children age 9-23 months. For non-breastfeeding children age 6-23 months it is defined as receiving solid, semi-solid or soft foods, or milk feeds, at least 4 times.

^h The minimum acceptable diet for breastfed children age 6-23 months is defined as receiving the minimum dietary diversity and the minimum meal frequency, while it for non-breastfed children further requires at least 2 milk feedings and that the minimum dietary diversity is achieved without counting milk feeds.

7.6 MALNUTRITION

Children's nutritional status reflects their overall health. When children have access to an adequate food supply, are not exposed to repeated illness, and are well cared for, they reach their growth potential and are considered well-nourished.

Undernutrition is associated with nearly half of all child deaths worldwide.⁹⁶ Children suffering from undernutrition are more likely to die from common childhood ailments, and those who survive often suffer recurring sicknesses and faltering growth. Three-quarters of children who die from causes related to undernutrition only had mild or moderate forms of undernutrition, meaning they showed little outward sign of their vulnerability.⁹⁷ The Sustainable Development Goal target 2.2 is to reduce the prevalence of stunting among children under five by 40 per cent between 2,012 and 2,025 as well as to reduce wasting to <5 per cent and have no increase in overweight over the same period. A reduction in the prevalence of malnutrition will also contribute to the achievement of several other global goals, including the goal to end preventable newborn and child deaths.

In a well-nourished population, there is a reference distribution of height and weight for how children under 5 should grow. The reference population used in this report is based on the WHO growth standards.⁹⁸ Undernutrition in a population can be gauged by comparing children to this reference population. Each of the three nutritional status indicators – weight-for-age, height-for-age, and weight-for-height – can be expressed in standard deviation units (z-scores) from the median of the reference population.

Weight-for-age is a measure of both acute and chronic malnutrition. Children whose weight-for-age is more than two standard deviations below the median of the reference population are considered moderately or severely underweight, while those whose weight-for-age is more than three standard deviations below the median are classified as severely underweight.

Height-for-age is a measure of linear growth. Children whose height-for-age is more than two standard deviations below the median of the reference population are considered short for their age and are classified as moderately or severely stunted. Those whose height-for-age is more than three standard deviations below the median are classified as severely stunted. Stunting, or chronic malnutrition, is the result of failure to receive adequate nutrition in early life over an extended period and/or recurrent or chronic illness.

Weight-for-height can be used to assess wasting and overweight status. Children whose weight-for-height is more than two standard deviations below the median of the reference population are classified as moderately or severely wasted, while those who fall more than three standard deviations below the median are classified as severely wasted. Wasting is usually the result of poor nutrient intake or disease. The prevalence of wasting may shift seasonally in response to changes in the availability of food and/or disease prevalence.

⁹⁹See MICS Supply Procurement Instructions: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 23, 2018. <http://mics.unicef.org/tools#survey-design>.

Children whose weight-for-height is more than two standard deviations above the median reference population are classified as moderately or severely overweight.

In MICS, weights and heights of all children under 5 years of age were measured using the anthropometric equipment recommended by UNICEF. Findings in this section are based on the results of these measurements in conjunction with the age in months data based on birth dates collected during the survey interview.

Table TC.8.1 shows percentages of children classified into each of the above described categories, based on the anthropometric measurements that were taken during fieldwork. Additionally, the table includes mean z-scores for all three anthropometric indicators.

Children whose measurements were not taken due to absence from the home during interviews or other reasons, or whose measurements are outside a plausible range are excluded from Table TC.8.1. Children are excluded from one or more of the anthropometric indicators when their weights and heights have not been measured, or their age is not available, whichever applicable. For example, if a child has been weighed but his/her height has not been measured, the child is included in underweight calculations, but not in the calculations for stunting and wasting. Percentages of children by age and reasons for exclusion are shown in the data quality tables DQ.3.4, DQ.3.5, and DQ.3.6 in Appendix D. The tables show that due to incomplete dates of birth, implausible measurements, and/or missing weight and/or height, 2.8 percent of children have been excluded from calculations of the weight-for-age indicator, 4.8 percent from the height-for-age indicator, and 5.7 percent for the weight-for-height indicator.

7.7 SALT IODISATION

Iodine Deficiency Disorders (IDD) are the world's leading cause of preventable brain damage and impaired psychomotor development in young children.¹⁰⁰ In its most extreme form, iodine deficiency causes cretinism. It also increases the risks of stillbirth and miscarriage in pregnant women. Iodine deficiency is most commonly and visibly associated with goitre. IDD takes its greatest toll in impaired mental growth and development, contributing to poor learning outcomes, reduced intellectual ability, and impaired work performance.¹⁰¹ The indicator reported in MICS is the percentage of households consuming iodized salt as assessed using rapid test kits.

In Tonga 2,019 MICS, salt used for cooking in the household was tested for presence of iodine using rapid test kits for potassium iodide. Table TC.9.1 presents the percent distribution of households by consumption of iodized salt.

Table TC.9.1: Iodised salt consumption

Percent distribution of households by consumption of iodised salt, Tonga MICS, 2019

7.8 EARLY CHILDHOOD DEVELOPMENT

It is well recognized that a period of rapid brain development occurs in the first years of life, and the quality of children's home environment and their interactions with caregivers is a major determinant of their development during this period.¹⁰² Children's early experiences with responsive caregiving serves an important neurological function and these interactions can boost cognitive, physical, social and emotional development.¹⁰³ In this context, engagement of adults in activities with children, presence of books and playthings in the home for the child, and the conditions of care are important indicators.

Information on a number of activities that provide children with early stimulation and responsive care was collected in the survey and presented in Table TC.10.1. These included the involvement of adults in the household with children in the following activities: reading books or looking at picture books, telling stories, singing songs, taking children outside the home, compound or yard, playing with children, and spending time with children naming, counting, or drawing things.

Exposure to books in early years not only provides children with greater understanding of the nature of print, but may also give them opportunities to see others reading, such as older siblings doing school work. Presence of books is important for later school performance. The mothers/caretakers of all children under 5 were asked about the number of children's books or picture books they have for the child, and the types of playthings that are available at home. The findings are presented in Table TC.10.2.

Some research has found that leaving children without adequate supervision is a risk factor for unintentional injuries.¹⁰⁴ In MICS, two questions were asked to find out whether children age 0-59 months were left alone during the week preceding the interview, and whether children were left in the care of other children under 10 years of age. This is presented in Table TC.10.3.

7.9 EARLY CHILD DEVELOPMENT INDEX

Early childhood development is multidimensional and involves an ordered progression of motor, cognitive, language, socio-emotional and regulatory skills and capacities across the first few years of life.¹⁰⁵ Physical growth, literacy and numeracy skills, socio-emotional development and readiness to learn are vital domains of a child's overall development, which build the foundation for later life and set the trajectory for health, learning and well-being.¹⁰⁶

A 10-item module was used to calculate the Early Child Development Index (ECDI). The primary purpose of the ECDI is to inform public policy regarding the developmental status of children in Tonga. The index is based on selected milestones that children are expected to achieve by ages 3 and 4. The 10 items are used to determine if children are developmentally on track in four domains:

- Literacy-numeracy: Children are identified as being developmentally on track based on whether they can identify/name at least ten letters of the alphabet, whether they can read at least four simple, popular words, and whether they know the name and recognize the symbols of all numbers from 1 to 10. If at least two of these are true, then the child is considered developmentally on track.
- Physical: If the child can pick up a small object with two fingers, like a stick or a rock from the ground and/or the mother/caretaker does not indicate that the child is sometimes too sick to play, then the child is regarded as being developmentally on track in the physical domain.
- Social-emotional: Children are considered to be developmentally on track if two of the following are true: If the child gets along well with other children, if the child does not kick, bite, or hit other children and if the child does not get distracted easily.
- Learning: If the child follows simple directions on how to do something correctly and/or when given something to do, is able to do it independently, then the child is considered to be developmentally on track in this domain.

ECDI is then calculated as the percentage of children who are developmentally on track in at least three of these four domains. The findings are presented in Table TC.11.1.

8 LEARN

v

Readiness of children for primary school can be improved through attendance to early childhood education programmes or through pre-school. Early childhood education programmes include programmes for children that have organised learning components as opposed to baby-sitting and day-care which do not typically have organised education and learning.

The age for compulsory education in Tonga is between 4 and 18 years of age. Accordingly, a child is deemed to be of compulsory school age if the child has attained the age of 4 years and has not attained the age of 19 years. The Ministry of Education (MOE) ensures that all children in Tonga who are 4 to 5 years of age have access to education at an early childhood education centre. In overseeing the provision of early childhood education in Tonga, the MOE works include the following services:

- production and dissemination of culturally appropriate developmental learning resources;
- support for the development of new early childhood centres in areas where there is no provision, and expansion of the sector to improve access for vulnerable and disadvantaged children;
- development of learning and development standards for early childhood education curriculum
- development of good quality teaching and learning resources;
- development of coherent and holistic national policy and planning frameworks for the development of the sector;
- establishment of a national database to collect accurate disaggregated data from the early childhood education sector;
- other services and initiatives necessary

Table LN.1.1 shows the percent of children age 3 and 4 years currently attending early childhood education: MICS indicator LN.1. This is based on question UB8 in the Questionnaire for Children under 5. If the child was currently on a school break, but regularly attends, the interviewer is asked to record this as currently attending.

Table LN.1.2 is similar to Table LN.1.1, but looks only at children who were 5 years old at the beginning of the school year. In Tonga, the school year begins in January.

Specifically, the table presents the percent distribution of children age one year younger than the official primary school entry age at the beginning of the school year, by attendance to education. This table utilises question UB7 for attendance. The indicator captured is the adjusted net attendance ratio, which corresponds to SDG indicator 4.2.2: Participation rate in organised learning (adjusted¹⁰⁷). The official primary school entry age in Tonga is age 6 years.

Additionally, Table LN.1.2 presents parity indices in support of SDG indicator 4.5.1, specifically on the gender, wealth and area disaggregates of SDG indicator 4.2.2. Generally, when an index value falls between 0.97 and 1.03, it is regarded as parity between two groups. The further from 1.00 that a parity index lies, the greater the disparity between groups.

Parity indices are also presented in Table LN.2.8 (for attendance to primary, lower and upper secondary school) and in Tables LN.4.1 and LN.4.2 (for reading and numeracy skills, respectively).

¹⁰⁷The ratio is termed “adjusted” since it also includes children attending primary education. All children age one year before official primary school entry age (at the beginning of the school year) are included in the denominator.

8.2 ATTENDANCE

Attendance to pre-primary education is important for the readiness of children to school. Table LN.2.1 shows the proportion of children in the first grade of primary school (regardless of age) who attended any early childhood education the previous year¹⁰⁸.

Ensuring that all girls and boys complete primary and secondary education is a target of the 2030 Agenda for Sustainable Development. Education is a vital prerequisite for combating poverty, empowering women, economic growth, protecting children from hazardous and exploitative labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and influencing population growth.

In Tonga, children enter primary school at age 6, lower secondary at age 12 and upper secondary school at age 16. There are 6 grades in primary school and 4 + 3 grades in secondary school. In primary school, grades are referred to as class 1 to class 6. For lower secondary school, grades are referred to as form 1 to form 4 and in upper secondary to form 5 to form 7. The school year typically runs from January to December of the same year.

Table LN.2.2 presents the percentage of children of primary school entry age entering class 1.

Table LN.2.3 provides the percentage of children of primary school age 6 to 11 years who are attending primary or secondary school¹⁰⁹, and those who are out of school. Similarly, the lower secondary school adjusted net attendance ratio is presented in Table LN.2.4¹¹⁰ for children age 12 to 15 years.

In Table LN.2.5, children are distributed according to their age against current grade of attendance (age-for-grade). For example, an 8-year-old child (at the beginning of the school year) is expected to be in year 3, as per the official age-for-grade. If this child is currently in year 1, he/she will be classified over-age by 2 years. The table includes both primary and lower secondary levels.

The upper secondary school adjusted net attendance ratio, and out of school children ratio are presented in Table LN.2.6¹¹¹

The gross intake rate to the last grade of primary school, primary school completion rate and transition rate to secondary education are presented in Table LN.2.7. The gross intake rate is the ratio of the total number of students, regardless of age, entering the last grade of primary school for the first time, to the number of children of the primary graduation age at the beginning of the current (or most recent) school year.

Completion rate of primary education represents the percentage of a cohort of children aged 3 to 5 years above the official age of the last grade of primary education, that is, the percentage of children who are 14 to 16 years old, who completed primary education in Tonga. Completion rates are also presented lower and upper secondary education.

The table also provides the “effective” transition rate¹¹², defined as the percentage of children who continued to the next level of education – the number of children who are attending the first grade of the higher education level in the current school year and were in the last grade of the lower education level the previous year divided by the number of children who were in the last grade of the lower education level the previous school year and are not repeating that grade in the current year.

¹⁰⁸The computation of the indicator does not exclude repeaters, and therefore is inclusive of both children who are attending primary school for the first time, as well as those who were in the first grade of primary school the previous school year and are repeating. Children repeating may have attended pre-primary education prior to the school year during which they attended the first grade of primary school for the first time; these children are not captured in the numerator of the indicator.

¹⁰⁹Ratios presented in this table are “adjusted” since they include not only primary school attendance, but also secondary school attendance in the numerator.

¹¹⁰Ratios presented in this table are “adjusted” since they include not only lower secondary school attendance, but also attendance to higher levels in the numerator.

¹¹¹Ratios presented in this table are “adjusted” since they include not only upper secondary school attendance, but also attendance to higher levels in the numerator.

¹¹²The simple transition rate, which is no longer calculated in MICS, tends to underestimate pupils’ progression to secondary school as it assumes that the repeaters never reach secondary school.

A low effective transition rate indicates that a low percentage of students are transitioning to the next level of education. This brings to light the existence of potential barriers in an education system including: financial burden such as enrolment fees or the obligation to purchase textbooks or school uniforms; education supply and quality issues such as a limited number of teachers or classrooms and low-quality teaching; as well as social and individual beliefs on education such as low expectation in returns of advancing in education.

Table LN.2.8 focusses on the ratio of girls to boys attending primary and secondary education. These ratios are better known as the Gender Parity Index (GPI). Note that the ratios included here are obtained from adjusted net attendance ratios rather than gross attendance ratios. The latter provide an erroneous description of the GPI mainly because, in most cases, the majority of over-age children attending primary education tend to be boys.

The table also presents additional parity indices in support of SDG Target 4.5: By 2030, eliminate gender disparities in education and ensure equal access to all levels of education and vocational training for the vulnerable, including persons with disabilities, indigenous peoples and children in vulnerable situations. Specifically, the orphanhood parity index accommodates the need for continuing presentation of data related to the previous MDG indicator 6.4. It should be noted that this indicator was measured on the age group of 10-14 years alone, whereas this replacing measure is on attendance for each of the three levels of education presented.

The further from 1 a parity index lies, the greater the disparity between groups. When an index value falls between 0.97 and 1.03, it is regarded as parity between two groups.

8.3 PARENTAL INVOLVEMENT

Parental involvement in their children's education is widely accepted to have a positive effect on their child's learning performance. For instance, reading activities at home have significant positive influences on reading achievement, language comprehension and expressive language skills.¹¹³ Research also shows that parental involvement in their child's literacy practices is a positive long-term predictor of later educational attainment.¹¹⁴

Beyond learning activities at home, parental involvement that occurs in school (like participating in school meetings, talking with teachers, attending school meetings and volunteering in schools) can also benefit a student's performance.¹¹⁵ Research studies have shown that, in the primary school age range, the impact of parental involvement in school activities can even be much bigger than differences associated with variations in the quality of schools, regardless of social class and ethnic group.¹¹⁶

The PR module included in the Questionnaire for children age 5-17 years was developed and tested for inclusion in MICS6. The work is described in detail in MICS Methodological Papers (Paper No. 5).¹¹⁷

Table LN.3.1 presents percentages of children age 7-14 years for whom an adult household member received a report card and was involved in school management and school activities in the last year, including discussion with teachers on children's progress.

In Table LN.3.2 reasons for children unable to attend class due to a school-related reasons are presented. Reasons include natural and man-made disaster, teacher strike and teacher absenteeism.

Lastly, Table LN.3.3 shows learning environment at home, i.e., percentage of children with 3 or more books to read, percentage of children who have homework, percentage whose teachers use the language also spoken at home, and percentage of children who receive help with homework.

^ This table utilises information collected in both the Parental Involvement and Foundational Learning Skills modules. Note that otherwise identical denominators may be slightly different, as the Foundational Learning Skills module includes consent of respondent to interview child and assert and availability of child to be interviewed. This invariably reduces the number of cases for data collected in this module.						
c The category of 'DK/Missing' in the background characteristic of 'Mother's education' has been suppressed from the table due to small number of unweighted cases.

8.4 FOUNDATIONAL LEARNING SKILLS

The ability to read and understand a simple text is one of the most fundamental skills a child can learn. Yet in many countries, students enrolled in school for as many as 6 years are unable to read and understand simple texts, as shown for instance by regional assessments such as the Latin American Laboratory for Assessment of the Quality of Education (LLECE), the Analysis Programme of the CONFEMEN Education Systems (PASEC) and the Southern and Eastern Africa Consortium for Monitoring Educational Quality (SACMEQ). Acquiring literacy in the early grades of primary is crucial because doing so becomes more difficult in later grades, for those who are lagging behind.¹¹⁹

A strong foundation in basic numeracy skills during the early grades is crucial for success in mathematics in the later years. Mathematics is a skill very much in demand and most competitive jobs require some level of skill in mathematics. Early mathematical knowledge is a primary predictor of later academic achievement and future success in mathematics is related to an early and strong conceptual foundation.¹²⁰

There are a number of existing tools for measuring learning outcomes¹²¹ with each approach having their own strengths and limitations as well as varying levels of applicability to household surveys such as MICS. For some international assessments, it may just be too late: “Even though international testing programs like PISA and TIMSS are steadily increasing their coverage to also cover developing countries, (...) much of the divergence in test scores happens before the points in the educational trajectories of children where they are tested by international assessments”, according to longitudinal surveys like the Young Lives Study.¹²² National assessments such as the Early Grade Reading Assessment, which happens earlier and is more context specific, will however be less appropriate for cross-country analysis; although it may be possible to compare children who do not complete an exercise (zero scores) set at a level which reflects each national target for children by a certain age or grade. Additionally, it is recognized that some assessments only capture children in school. However, given that many children do not attend school, further data on these out-of-school children is needed and these can be adequately captured in household surveys.

Tables LN.4.1 and LN.4.2 present percentages of children age 7-14 years who correctly answered foundational reading¹²³ tasks and numeracy skills, respectively, by age, sex, location, division, wealth index quintile and other disaggregation. These MICS indicators are designed and developed for both national policy development and SDG reporting for SDG4.1.1(a): Proportion of children in grade 2/3 achieving a minimum proficiency in (i) reading and (ii) mathematics by sex.

¹²³In Tonga MICS, a reading passage was customised based on guidance provided by technical experts. Please refer to Appendix E (Reading & Numbers Book) for the task (in English and in Tongan Language).

The assessment score of reading tasks is further disaggregated by results of the literal questions and inferential questions. The disaggregation of numeracy skills such as number reading, number discrimination, addition and pattern recognitions are also available.

The section of the Foundational Learning module capturing numeracy skills can be found in Appendix E (Questionnaire for children age 5-17 years), questions FL23-FL27. Specifically question FL26 is a set of instructions for the interviewer, including to administer two practise items to prepare the child for the following task of pattern recognition and completion. This task (question FL27) includes five items.

9 PROTECTED FROM VIOLENCE AND EXPLOITATION

9.1 BIRTH REGISTRATION

A name and nationality is every child's right, enshrined in the Convention on the Rights of the Child (CRC) and other international treaties. Registering children at birth is the first step in securing their recognition before the law, safeguarding their rights, and ensuring that any violation of these rights does not go unnoticed.¹²⁴ Birth certificates are proof of registration and the first form of legal identity and are often required to access health care or education. Having legal identification can also be one form of protection from entering into marriage or the labour market, or being conscripted into the armed forces, before the legal age. Birth registration and certification is also legal proof of one's place of birth and family ties and thus necessary to obtain a passport. In adulthood, birth certificates may be required to obtain social assistance or a job in the formal sector, to buy or inherit property and to vote.

Official birth registration numbers are also important for national planning as they provide information to institutions with responsibility for developing policies and allocating resources to support critical social services such as health, education and labour.

The recording and registration of births in Tonga is governed by the Births, Deaths and Marriages Registration Act (1988) and the Adoption Act (1994).

The birth registration process is initiated through a birth notification (Certificate of Live Birth), issued by the Ministry of Health, in both community and hospital settings. Town and District Officers who are government officials under the Ministry of Internal Affairs, in addition to the child's parents, are designated by the law as informants of birth, and must present to the Vital Statistic Unit within the Civil Registration Division of the Ministry of Justice with a copy of the Certificate of Live Birth in order to register the birth. Births in the outer Divisions of 'Eua, Ha'apai, Vava'u and the Niuas can be registered in sub-registries. Birth Certificates are issued after the registration process is completed.

9.2 CHILD DISCIPLINE

Teaching children self-control and acceptable behaviour is an integral part of child discipline in all cultures. Positive parenting practices involve providing guidance on how to handle emotions or conflicts in manners that encourage judgment and responsibility and preserve children's self-esteem, physical and psychological integrity and dignity. Too often however, children are raised using punitive methods that rely on the use of physical force or verbal intimidation to obtain desired behaviours. Studies¹²⁵ have found that exposing children to violent discipline has harmful consequences, which range from immediate impacts to long-term harm that children carry forward into adult life. Violence hampers children's development, learning abilities and school performance; it inhibits positive relationships, provokes low self-esteem, emotional distress and depression; and, at times, it leads to risk taking and self-harm.

In the Tonga MICS, 2019 mothers or caretakers of children under age five and of one randomly selected child aged 5-17 were asked a series of questions on the methods adults in the household used to discipline the child during the past month and if the respondent believes that physical punishment is a necessary part of child-rearing. Tables PR.2.1 and PR.2.2 present the results.

In Tonga, the use of violence as a form of discipline is considered part of 'normal' behaviour of families and parents. The Criminal Offences Act 1988 penalises assault and bodily harm and cruelty to children under 16. The Family Protection Act 2013 criminalises domestic violence and states that committing an act of violence against a child, or in the presence of a child, is an aggravating circumstance.

9.3 CHILD LABOUR

Children around the world are routinely engaged in paid and unpaid forms of work that are not harmful to them. However, they are classified as child labourers when they are either too young to work or are involved in hazardous activities that may compromise their physical, mental, social or educational development. Article 32 (1) of the CRC states: "States Parties recognize the right of the child to be protected from economic exploitation and from performing any work that is likely to be hazardous or to interfere with the child's education, or to be harmful to the child's health or physical, mental, spiritual, moral or social development".

Tonga does not have a law specifying a minimum age for work or defining hazardous forms of work for children, and Tonga has not ratified the International Labour Organisation conventions 138 (Minimum Age) and 182 (Worst Forms of Child Labour). Limited research has been done on child labour in Tonga, however available research suggests that children in urban settings in Tonga are engaged in housework. Engagement in more hazardous types of work has not been informed.¹²⁶

The child labour module was administered for one randomly selected child age 5-17 years in each household and includes questions on the type of work a child does and the number of hours he or she is engaged in it. Data are collected on both economic activities (paid or unpaid work for someone who is not a member of the household, work for a family farm or business) and domestic work (household chores such as cooking, cleaning or caring for children, as well as collecting firewood or fetching water).^{127,128,129}

Table PR.3.1 presents children's involvement in economic activities. The methodology of the MICS Indicator on Child labour uses three age-specific thresholds for the number of hours children can perform economic activity without being classified as child labourers. A child that performed economic activities during the last week for more than the age-specific number of hours is classified as in child labour:

- i. age 5-11: 1 hour or more
- ii. age 12-14: 14 hours or more
- iii. age 15-17: 43 hours or more

Table PR.3.2 presents children's involvement in household chores. As for economic activity above, the methodology also uses age-specific thresholds for the number of hours children can perform household chores without being classified as child labourers. A child that performed household chores during the last week for more than the age-specific number of hours is classified as in child labour.¹³⁰

- i. age 5-11 and age 12-14: 21 hours or more
- ii. age 15-17: No limit to number of hours

¹²⁶UNICEF, 2017, Pacific Regional Child Protection Situation Analysis

¹²⁷'Own use production of goods', including activities such as fetching water and collecting firewood, falls within the production boundary set by the United Nations System of National Accounts. However, for the purpose of SDG reporting of indicator 8.7.1, and with the goal of facilitating international comparability, fetching water and collecting firewood have been classified as unpaid household services (i.e., household chores), a form of production that lies outside the production boundary.

¹²⁸UNICEF. *How Sensitive Are Estimates of Child Labour to Definitions?*. MICS Methodological Paper No. 1. New York: UNICEF, 2012. https://data.unicef.org/wp-content/uploads/2015/12/Child_Labour_Paper_No.1_FINAL_162.pdf.

¹²⁹The Child Labour module was administered in the Questionnaire for Children Age 5-17 (See Appendix E: Questionnaires). In households with at least one child age 5-17, one child was randomly selected. To account for the random selection, the household sample weight is multiplied by the total number of children age 5-17 in each household; this weight is used when producing the relevant tables.

¹³⁰Note that the age-specific thresholds for household chores have changed during the implementation of the sixth round of MICS. Comparison to other data sources, including previous MICS surveys, should be done with caution.

SDG Target 8.7 aims to “take immediate and effective measures to eradicate forced labour, end modern slavery and human trafficking and secure the prohibition and elimination of the worst forms of child labour, including recruitment and use of child soldiers, and by 2025 end child labour in all its forms.” The SDG indicator 8.7.1 provides the proportion of children aged 5-17 years who are engaged in child labour. Two measures of the indicator are presently in use, the first based on the production boundary set by the United Nations System of National Accounts (using above age-thresholds on economic activities alone) and the second based on the general production boundary (classifying as child labour if age-specific thresholds are exceeded on either or both economic activities or household chores). Table PR.3.3 presents both of these two measures. The MICS Indicator PR.3 is based on the second, i.e. using the general production boundary.

Pertaining to the overall concept of child labour, the module also collects information on hazardous working conditions. Table PR.3.4 presents the percentage of children involved in each of the hazardous activities included in the survey. Note, however, that the present definition, also used for SDG reporting, does not include involvement in hazardous working conditions, as further methodological work is needed to validate questions specifically aimed at identifying children working under such hazardous conditions.

Table PR.3.1: Children's involvement in economic activities

^aNote that the threshold of number of hours was changed during MICS6 implementation, due to a change in the SDG indicator definition: From 28 to 21 hours for both children age 5-11 and 12-14 years. In the new definition, there is no longer a maximum number of hours for chores of children age 15-17 years.

^bIncludes attendance to early childhood education

^cThe category of "Don't know/Missing" in the background characteristic of "Mother's education" and "Child functional difficulties" has been suppressed from the table due to small number of unweighted cases

9.4 CHILD MARRIAGE

Marriage¹³¹ before the age of 18 is violation of human rights, yet remains a reality for many children. The right to 'free and full' consent to a marriage is recognized in the Universal Declaration of Human Rights - with the recognition that consent cannot be 'free and full' when one of the parties involved is not sufficiently mature to make an informed decision about a life partner. In the Sustainable Development Goals, child marriage has been identified as a harmful practice which the world should aim to eliminate by 2030.

Child marriage is more common among girls than boys, but does occur around the world among children of both sexes. The impacts specific to boys married in childhood are not yet well understood, but marriage does place boys in an adult role accompanied by responsibilities for which they may not be prepared.

In many parts of the world parents encourage the marriage of their daughters while they are still children in hopes that the marriage will benefit them both financially and socially, while also relieving financial burdens on the family. In actual fact, child marriage compromises the development of girls and often results in early pregnancy and social isolation, with little education and poor vocational training reinforcing the gendered nature of poverty.¹³²

Closely related to the issue of child marriage is the age at which sexual activity – and for females, childbearing – may begin. Women who were married before the age of 18 tend to have more children than those who marry later in life and are less likely to receive maternal health care services.^{133,134} In addition, pregnancy related deaths are known to be a leading cause of mortality for both married and unmarried girls between the ages of 15 and 19.

Tables PR.4.1W and PR.4.1M present the percentage of women and men married before ages 15 and 18 years, the percentage of adolescent girls and boys aged 15-19 who are currently married, and the percentage of women and men in a polygynous union.

Tables PR.4.2W and PR.4.2M present, respectively, the proportion of women and men who were first married or entered into a marital union before age 15 and 18 by area and age groups. Examining the percentages married before ages 15 and 18 across different age groups allow for trends to be observed in child marriage over time.

Another component is the spousal age difference with the indicator being the percentage of married/in union women 10 or more years younger than their current spouse. Table PR.4.3 presents the results of the age difference between women and their husband or partner.

¹³¹All references to marriage in this chapter include cohabiting unions as well.

9.5 VICTIMISATION

Crime can have a large impact the lives of victims and the wider community in which they live. Those who are victims of crimes can suffer physically and psychologically and experience loss of assets and income. Crime can also carry significant economic costs to the community through the provision of preventative measures as well as corrective services.¹³⁵

Tables PR.6.1W and PR.6.1M present the percentage of women and men who were victims of robbery or assault in the last 3 and 1 year prior to the survey, by various background characteristics. Tables PR.6.2W and PR.6.2M show if weapons (namely, knife, gun or other weapons) were used during the last robbery. Tables PR.6.3W and PR.6.3M expand on the circumstances of the latest assault, indicating where it took place and type of weapon used. Finally, Tables P.R6.4W and P.R6.4M indicate if the last robbery or assault experienced by women and men was reported to the police.

¹³⁵United Nations Office on Drugs and Crime, and United Nations Economic Commission for Europe. *Manual on Victimization Surveys*. Geneva: UN. https://www.unodc.org/documents/data-and-analysis/Crime-statistics/Manual_on_Victimization_surveys_2009_web.pdf.

9.6 FEELINGS OF SAFETY

Questions about fear, such as feelings of safety and perceptions of crime as a problem, indicate respondents' level of perceived safety in everyday life. This is important as such perceptions limit people's freedom of movement and influence how they manage threats to their safety¹¹

Tables PR.7.1W and PR.7.1M present data for women and men on their feelings of safety for walking alone in their neighbourhood after dark and for being at home alone after dark.

Table PR.7.1W: Feelings of safety (women)

9.7 ATTITUDES TOWARDS DOMESTIC VIOLENCE

Tonga MICS, 2019 assessed the attitudes of women and men age 15-49 years towards wife/partner beating by asking the respondents whether they think that husbands/partners are justified to hit or beat their wives/partners in a variety of situations. The purpose of these questions is to capture the social justification of violence (in contexts where women have a lower status in society) as a disciplinary action when a woman does not comply with certain expected gender roles. The responses to these questions can be found in Table PR.8.1W for women and in Table PR.8.1M for men.

Tables PR.8.2W and PR8.2.M present data for women and men attitudes toward negotiating safer sexual relationships with husband/partner.

The normalisation of violence as a form of punishment and discipline within many families and communities has been highlighted as a key factor contributing to violence against children. In Tonga, for example, the National Study on Domestic Violence noted that “the phenomenon of violence against women and against children, is widespread and deeply ingrained in Tongan society.”¹³⁶

¹³⁶Pacific Women, 2009, National Study on Domestic Violence against Women in Tonga

Table PR.8.1W: Attitudes toward domestic violence (women)

Percentage of women age 15-49 years who believe a husband is justified in beating his wife in various circumstances,
Tonga MICS, 2019

	Percentage of women who believe a husband is justified in beating his wife:						Number of women
	If she goes out without telling him	If she neglects the children	If she argues with him	If she refuses sex with him	If she burns the food	For any of these five reasons ¹

10 LIVE IN A SAFE AND CLEAN ENVIRONMENT

10.1 DRINKING WATER

Access to safe drinking water, sanitation and hygiene (WASH) is essential for good health, welfare and productivity and is widely recognised as a human right.¹³⁷ Inadequate WASH is primarily responsible for the transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain a leading global cause of child deaths.

Drinking water may be contaminated with human or animal faeces containing pathogens, or with chemical and physical contaminants with harmful effects on child health and development. While improving water quality is critical to prevent disease, improving the accessibility and availability of drinking water is equally important, particularly for women and girls who usually bear the primary responsibility for carrying water, often for long distances.¹³⁸

The SDG targets relating to drinking water are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.1). For more information on global targets and indicators please visit the website of the WHO/UNICEF Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.¹³⁹

The distribution of the population by main source of drinking water is shown in Table WS.1.1. The population using improved sources of drinking water are those using any of the following types of supply: piped water (into dwelling, compound, yard or plot, to neighbour, public tap/standpipe), rainwater collection, and packaged or delivered water.¹⁴⁰

Table WS.1.2 shows the amount of time taken per round trip to collect water for users of improved and unimproved sources. Household members using improved water sources located on premises or requiring up to and including 30 minutes per trip for water collection meet the SDG criteria for a ‘basic’ drinking water service.

Table WS.1.3 presents the sex and age of the household member usually responsible for water collection among household members without water sources on premises. Table WS.1.4 shows the average time spent each day by the household member mainly responsible for collecting drinking water.

Table WS.1.5 shows the proportion of household members with sufficient water available when needed from their main source of drinking water and the main reasons household members are unable to access water in sufficient quantities when needed.

Table WS.1.6 presents the proportion of household members with an indicator of faecal contamination detected in their drinking water source. The risk of faecal contamination is shown based on the number of Escherichia coli (E. coli) bacteria detected, ranging from low (<1 E. coli per 100 mL), to moderate (1-10 E. coli per 100 mL), high (11-100 E. coli per 100 mL) and very high risk (>100 E. coli per 100 mL).

Table WS.1.7 shows the proportion of household members with E. coli detected in their household drinking water. Contamination may occur between the source and the household during transport, handling and storage.

¹³⁷The human rights to water and sanitation were explicitly recognised by the UN General Assembly and Human Rights Council in 2010 and in 2015.

¹³⁸WHO, and UNICEF. *Safely Managed Drinking Water: thematic report on drinking water*. Geneva: WHO Press, 2017. <https://data.unicef.org/wp-content/uploads/2017/03/safely-managed-drinking-water-JMP-2017-1.pdf>.

¹³⁹“Home.” JMP. Accessed September 06, 2018. <https://washdata.org/>.

¹⁴⁰Packaged water (bottled water and sachet water) and delivered water (tanker truck and cart with small drum/tank) are treated as improved based in new SDG definition.

Table WS.1.8 shows the proportion of household population with improved and unimproved drinking water sources located on premises, available when needed, and free from contamination. Households with improved sources accessible on premises, with sufficient quantities of water available when needed, and free from contamination meet the SDG criteria for ‘safely managed’ drinking water services.

Table WS.1.9 presents the main methods by which households report treating water in order to make it safer to drink. Boiling water, adding bleach or chlorine, using a water filter, and using solar disinfection are considered appropriate methods of water.

Table WS.1.1: Use of improved and unimproved water sources

10.2 HANDWASHING

Handwashing with water and soap is the most cost-effective health intervention to reduce both the incidence of diarrhoea and pneumonia in children under five.¹⁴¹ It is most effective when done using water and soap after visiting a toilet or cleaning a child, before eating or handling food and before feeding a child. Direct observation of handwashing behaviour at these critical times is challenging. A reliable alternative to observations is assessing the likelihood that correct handwashing behaviour takes place by asking to see the place where people wash their hands and observing whether water and soap (or other local cleansing materials) are available at this place.^{142,143}

Hygiene was omitted from the MDGs but has been included in the SDG targets which aim to achieve universal access to a basic handwashing facility at home (SDG 1.4 and 6.2).

Table WS.2.1 shows the proportion of household members with fixed or mobile handwashing facilities observed on premises (in the dwelling, yard or plot). It also shows the proportion of handwashing facilities where water and soap were observed. Household members with a handwashing facility on premises with soap and water available meet the SDG criteria for a ‘basic’ handwashing facility.

¹⁴¹Cairncross, S. and V. Valdmanis. “Water supply, sanitation and hygiene promotion Chapter 41.” in *Disease Control Priorities in Developing Countries. 2nd Edition*, edited by Jameson et al. Washington (DC): The International Bank for Reconstruction and Development / The World Bank.

¹⁴²Ram, P. *Practical Guidance for Measuring Handwashing Behavior: 2013 Update*. Global Scaling Up Handwashing. Washington DC: World Bank Press, 2013.

¹⁴³Handwashing place or facilities may be fixed or mobile and include a sink with tap water, buckets with taps, tippy-taps, and jugs or basins designated for handwashing. Soap includes bar soap, liquid soap, powder detergent, and soapy water but does not include ash, soil, sand or other handwashing agents.

^a MICS indicator WS.7 - Handwashing facility with water and soap; SDG indicators 1.4.1 & 6.2.1^a Ash, mud, sand are not as effective as soap and not included in the MICS or SDG indicator.

10.3 SANITATION

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea as well as parasitic infections, such as soil transmitted helminths (worms). Improved sanitation and hygiene can reduce diarrhoeal disease by more than a third , and can substantially reduce the health impact of soil-transmitted helminth infection and a range of other neglected tropical diseases which affect over 1 billion people worldwide.¹⁴⁵

The SDG targets relating to sanitation are much more ambitious than the MDGs and variously aim to achieve universal access to basic services (SDG 1.4) and universal access to safely managed services (SDG 6.2).

An improved sanitation facility is defined as one that hygienically separates human excreta from human contact. Improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets. Table WS.3.1 shows the population using improved and unimproved sanitation facilities. It also shows the proportion who dispose of faeces in fields, forests, bushes, open water bodies of water, beaches or other open spaces, or with solid waste, a practice known as ‘open defecation’.

Table WS.3.2 presents the distribution of household population using improved and unimproved sanitation facilities which are private, shared with other households or public facilities. Those using shared or public improved sanitation facilities are classed as having a ‘limited’ service for the purpose of SDG monitoring. Households using improved sanitation facilities that are not shared with other households meet the SDG criteria for a ‘basic’ sanitation service, and may be considered ‘safely managed’ depending on how excreta are managed.

Table WS.3.3 shows the methods used for emptying and removal of excreta from improved pit latrines and septic tanks. Excreta from improved pit latrines and septic tanks that is never emptied (or don’t know if ever emptied) or is emptied and buried in a covered pit is classed as ‘safely disposed in situ’ and meets the SDG criteria for a ‘safely managed’ sanitation service. Excreta from improved pit latrines and septic tanks that is removed by a service provider to treatment may also be safely managed, depending on the type of treatment received. Other methods of emptying and removal are not considered ‘safely managed’.

Table WS.3.4 summarises the main ways in which excreta is managed from households with improved on-site sanitation systems (improved pit latrines and septic tanks) and compares these with the proportion with sewer connections, unimproved sanitation or practicing open defecation.

Table WS.3.5 shows the main methods used for disposal of child faeces among households with children aged 0-2 years. Appropriate methods for disposing of the stool include the child using a toilet or latrine and putting or rinsing the stool into a toilet or latrine. Putting disposable diapers with solid waste, a very common practice throughout the world, is only considered an appropriate means of disposal if there is also a system in place for hygienic collection and disposal of the solid waste itself. This classification is currently under review.

The JMP has produced regular estimates of national, regional and global progress on drinking water, sanitation

and hygiene (WASH) since 1990. The JMP service ‘ladders’ enable benchmarking and comparison of progress across countries at different stages of development. As of 2015, updated water and sanitation ladders have been introduced which build on established indicators and establish new rungs with additional criteria relating to service levels. A third ladder has also been introduced for handwashing hygiene.¹⁴⁶ Table WS.3.6 summarises the percentages of household population meeting the SDG criteria for ‘basic’ drinking water, sanitation and handwashing services.

^aIn many countries, disposal of children's faeces with solid waste is common. The risks vary between and within countries depending on whether solid waste is regularly collected and well managed; therefore, for the purposes of international comparability, solid waste is not considered safely disposed.

^bThe category of "Don't know/Missing" in the background characteristic of "Mother's education" has been suppressed from the table due to small number of unweighted cases

() Figures that are based on 25-49 unweighted cases

(*) Figures that are based on fewer than 25 unweighted cases

¹ MICS indicator WS.2 - Use of basic drinking water services; SDG Indicator 1.4.1² MICS indicator WS.9 - Use of basic sanitation services; SDG indicators 1.4.1 & 6.2.1

^ For the purposes of calculating the ladders, "No permission to see / other" is included in the denominator.

* Differs from the MICS indicator WS.7 "Handwashing facility with water and soap" (SDG indicators 1.4.1 & 6.2.1) as it includes "No permission to see / other". See table WS2.1 for MICS indicator WS.7

10.4 MENSTRUAL HYGIENE

The ability of women and adolescent girls to safely manage their monthly menstrual cycle in privacy and with dignity is fundamental to their health, psychosocial well-being and mobility. Women and girls who lack access to adequate menstrual hygiene management facilities and supplies experience stigma and social exclusion while also forgoing important educational, social and economic opportunities.¹⁴⁷

Table WS.4.1 shows the percentage of women and girls aged 15-49 who menstruated in the last 12 months reporting having a private place to wash and change while at home. It also presents whether they used appropriate materials including reusable and non-reusable materials during last menstruation. Table WS.4.2 shows the percentage of women who reported not being able to participate in social activities, school or work during their last menstruation.

¹⁴⁷Sommer, M., C. Sutherland and V. Chandra-Mouli. "Putting Menarche and Girls into the Global Population Health Agenda." *Reproductive Health* 12, no. 1 (2015). doi:10.1186/s12978-015-0009-8.

Table WS.4.1: Menstrual hygiene management

Percent distribution of women age 15-49 years by use of materials during last menstruation, percentage using appropriate materials, percentage with a private place to wash and change while at home and percentage of women using appropriate menstrual hygiene materials with a private place to wash and change while at home, Tonga MICS, 2019

11 EQUITABLE CHANCE IN LIFE

11.1 CHILD FUNCTIONING

The Convention on the Rights of Persons with Disabilities¹⁴⁸ outlines States Parties' obligations to ensure the full realization of rights for children with disabilities on an equal basis with other children. The presence of functional difficulties may place children at risk of experiencing limited participation in an unaccommodating environment and limit the fulfilment of their rights.

Tonga MICS, 2019 included child functioning modules intended to provide an estimate of the number/proportion of children with functional difficulties as reported by their mothers or primary caregivers. The module included in the Questionnaire for Children Under Five covered children between 2 and 4 years of age while a similar module is also included in the Questionnaire for Children Age 5-17.

Functional domains covered in Questionnaire for Children Under Five are as follows: Seeing, hearing, walking, fine motor, communication, learning, playing, and controlling behaviour while functional domains covered in Questionnaire for Children Age 5-17 are as follows: Seeing, hearing, walking, self-care, communication, learning, remembering, concentrating, accepting change, controlling behaviour, making friends, anxiety, and depression.

Tables EQ.1.1 and EQ.1.2 present the percentage of children by age group with functional difficulty by domain.

Table EQ.1.3 presents the percentage of children age 2-17 who use assistive devices and still have difficulty within the relevant functional domains.

Table EQ.1.4 is a summary table presenting the percentage of children by age group with functional difficulty.

¹⁴⁸"Convention on the Rights of Persons with Disabilities." United Nations. Accessed August 31, 2018. <https://www.un.org/development/desa/disabilities/convention-on-the-rights-of-persons-with-disabilities/convention-on-the-rights-of-persons-with-disabilities-2.html>.

11.2 SOCIAL TRANSFERS

Social protection is the set of public and private policies and programmes aimed at preventing, reducing and eliminating economic and social vulnerabilities to poverty and deprivation. Increasing volatility at the macro and household level, the persistence of inequalities and exclusion, threats posed to sustainable development by climate change and changing population trends have heightened the relevance and political momentum for social protection globally.¹⁴⁹

Social transfers or external economic support can be defined as ‘free economic help’ and includes various social protection schemes – examples in Tonga include aged-care services for elderly, disability welfare, early children intervention services, retirement and pension scheme and any other external assistance programme such as assistance for school fees, material support for education, food and housing support to cyclone affected areas, or any other types of ad-hoc support, excluding transfers or assistance from family members, relatives or neighbours.

Health insurance is one protection scheme and tables EQ.2.1W and EQ.2.1M present the percentage of women and men age 15-49 years who have a health insurance and among those with an insurance, the percentage insured by type of insurance. Tables EQ.2.2 and EQ.2.3 further elaborates the existence of health insurance for children under age five and 5-17 separately.

Table EQ.2.4 presents the percentage of households who are aware and have received external economic support, as reported by the respondent to the Household Questionnaire. The percentage of household members living in households that received social transfers or benefits in the last 3 months is further shown in Table EQ.2.5, by type of transfers and benefits. The benefits also include school tuition or school related other support available for any household member age 5-24. SDG indicator 1.3.1, the proportion of population covered by social protection floors/systems is presented in this table.

It is well known that social and economic shocks affect the health conditions of individuals and undermine household resilience. These shocks affect the capacity of families to care for their children and place barriers to services that stand in the way of achieving goals and progress for children. In particular poor households are vulnerable to the impacts of these shocks through the increased burden of health costs; the illness and death of household members, leading to labour constraints in the household and the further impoverishment of children who have lost one or both parents, or their primary caregiver; and other vulnerable children, cause them to drop out of school and engage in harmful child labour and other risky behaviours. As an attempt to measure coverage of social protection programmes, a global indicator, ‘Proportion of the poorest households that received external economic support in the past three months’, was proposed to measure the extent to which economic support is reaching households severely affected by various shocks.¹⁵⁰ Table EQ.2.6 presents the percentage of households in the lowest two quintiles that received social transfers or benefits in the last 3 months, by type of transfers or benefits.

Finally, Table EQ.2.7 presents the percentage of children under age 18 living in households that received social transfers or benefits in the last 3 months, by type of transfers or benefits, while Table EQ.2.8 presents the percentage of children and young people age 5-24 years in all households who are currently attending school and received support for school tuition and other school related support during the current school year.

11.3 DISCRIMINATION AND HARASSMENT

Discrimination can impede individuals from accessing opportunities and services in a fair and equal manner. These questions are designed to measure the experiences of discrimination and harassment of respondents in the 12 months before the survey. The questions include specific grounds of discrimination and harassment which can increase the respondents' recall of events. The current questions are based on a recommended set of questions available at the start of MICS6. The questions may change given that methodological development is currently underway to move the indicator from a Tier III SDG indicator classification to Tier II. Tables EQ.3.1W and EQ.3.1M show the percentage of women and men who felt discriminated against based on a number of grounds.

Table EQ.3.1W: Discrimination and harassment (women)

Percentage of women age 15-49 years who in the past 12 months have felt discriminated against or harassed and those who have not felt discriminated against or harassed, Tonga MICS, 2019

	Percentage of women who in the last 12 months have felt discriminated against or harassed on the basis of:							Percentage of women who have not felt discriminated against or harassed in the last 12 months	Number of women

¹ MICS indicator EQ.7 - Discrimination; SDG Indicators 10.3.1 & 16.b.1

^a The category of "DK/Missing" in the background characteristic of "Education" has been suppressed from the table due to small number of unweighted cases.

(*) Figures that are based on fewer than 25 unweighted cases

(†) Figures that are based on 25-49 unweighted cases

11.4 SUBJECTIVE WELL-BEING

Subjective perceptions of individuals of their incomes, health, living environments and the like, play a significant role in their lives and can impact their perception of well-being, irrespective of objective conditions such as actual income and physical health status.¹⁵¹

Tonga, 2019 MICS included a question about happiness and the respondents' overall satisfaction with life. To assist respondents in answering the question on happiness, they were shown a card with smiling faces (and not so smiling faces) that corresponded to the response categories (see the Questionnaires in Appendix E) 'very happy', 'somewhat happy', 'neither happy nor unhappy', 'somewhat unhappy' and 'very unhappy'. They were then shown a pictorial of a ladder with steps numbered from 0 at the bottom to 10 at the top and asked to indicate at which step of the ladder they feel they are standing at the time of the survey to indicate their level of life satisfaction. Tables EQ.4.1W and EQ.4.1M present the percentage of women age 15-49 years, and age 15-24 years separately, who are very or somewhat satisfied with their life overall, ladder step reported and the average life satisfaction score.

In addition to the questions on life satisfaction and happiness, respondents were also asked two simple questions on whether they think their life improved during the last one year, and whether they think their life will be better in one year's time. Such information may contribute to the understanding of desperation that may exist among young people, as well as hopelessness and hopes for the future. Specific combinations of the perceptions during the last one year and expectations for the next one year may be valuable information to understand the general sense of well-being among young people. In Tables EQ.4.2W and EQ.4.2M, women's and men's perceptions of a better life are shown.

12 DOMESTIC VIOLENCE

Domestic violence (DV) is one of the most pervasive and yet hidden human rights violation which affects one's health, economy, education and human development. The term 'domestic' includes violence perpetrated by an intimate partner and by other family members, wherever this violence takes place and in whatever form.¹⁵² While the immediate impact is individual, the pervasive nature of DV means that it has devastating effects in families, communities and across the world. Addressing violence against women is, therefore, a public health, human rights, economic and public policy priority.

The global dimensions of this type of violence are alarming, despite the existence of international conventions that seek to protect women's rights, such as the Convention on the Elimination of all Forms of Discrimination Against Women (CEDAW) and the 1993 Declaration on the Elimination of Violence against Women.¹⁵³ Global estimates by WHO indicate that one in three women worldwide have experienced either physical and/or sexual intimate partner violence or non- partner sexual violence in their lifetime.¹⁵⁴

The SDGs of which, target 5.2 is "Eliminate all forms of violence against all women and girls in public and private spheres, including trafficking and sexual and other types of exploitation" recognises the importance of the impact of *gender based* violence on gender equality and the public policy imperative the indicator speaks to. Indeed, *gender- based* violence is a manifestation of and serves to perpetuate gender inequality. It inhibits women's ability to enjoy rights and freedoms. That is, violence against women is a challenge to women's participation in development and peace.¹⁵⁵ Further, it is a critical public health issue, particularly affecting the health, including sexual and reproductive health and mental health of women. Countries cannot reach their full potential if women are not provided with equal opportunity to participate in society and the cost of violence will continue to hamper national development efforts as violence against women continues to undermine human and economic development.

Legislation on violence against women and girls, policies and measures

The enactment of the Family Protection Act 2013 (FPA 2013) was a milestone for Tonga as one of Government's commitment to providing greater protection of women and girls from domestic violence. The FPA 2013 provides protection for all members of the family and introduces protection orders, clarifies the duties of the police and promotes the health, safety and wellbeing of victims of domestic violence and related matters. In 2017, Government activated the Family Protection Trust Fund available for CSOs and NGOs working on the implementation of the FPA 2013. Other forms of violence are recognized under Tonga's Criminal Offences Act 1926. The National Women's Empowerment and Gender Equality Tonga (WEGET) Policy 2019-2025 priority outcome 2, "*Families and Communities prosper from gender equality*", continues to recognize domestic violence as a rampant problem in Tonga's society. The WEGET has an accompanying Strategic Plan of Action 2019-2025 that provides key outputs and actions that could potentially eliminate or reduce this issue. The establishment of the Family Protection Legal Aid Center in 2018 under the Ministry of Justice & Prisons, the renovated office for the DV Unit with a safe space for children at the Police Station and the 24/7 counselling helpline through the main service providers for victims of violence, have been some of the key achievements implemented in Tonga to support victims and survivors of family violence. The Women's Affairs and Gender Equality Division of the Ministry of Internal Affairs is the national women's machinery that plays the leading role of coordinating, monitoring and providing advisory services in respect of the WEGET. The Division also has a Family Protection Coordinator that coordinates work around the FPA 2013 with relevant stakeholders with support from various development partners including DFAT, SPC, FFOV, UN Women, UNDP and UNFPA.

12.1 METHODOLOGY

Tonga MICS 2019 collected data on DV by including a series of questions that were developed by the Demographic and Health Surveys.¹⁵⁶ The objective of the DV module is to measure the prevalence of physical, sexual and emotional violence against women and girls who are, or ever were, married or even who are, or ever have been, living with a man in an intimate relationship. This module also measures the prevalence of physical or sexual violence by perpetrators who are not spouses or cohabiting partners among women, regardless if they have or have not ever been married, since they were 15 years of age.

Only one woman among all women age 15-49 years from each household was randomly selected for the survey. As a result of the sensitive nature of the questions, it was very important to ensure that all responses were kept confidential and the process complied with ethical guidelines. A protection protocol/support plan was adopted to ensure confidentiality and safety, reduce any possible distress caused to the participants, and ensure that interviewers are trained to refer women who request assistance to available service providers including health, police, legal, social and community services.¹⁵⁷

Selected women who are, or ever were, married or even who are, or ever have been, living with a man in an intimate relationship were asked questions on emotional, physical and sexual violence from the domestic violence module. Participating women received questions on physical or sexual violence since the age of 15 years, by perpetrators who they were not married to or living together with a man in an intimate relationship.

In the Tonga MICS, physical violence refers to any act or conduct which can cause bodily pain, harm or danger to life and impair the health of a person. The specific acts that were asked about included pushing, throwing an object at the woman, smacking or slapping, twisting of the arm, pulling of the hair, punching with a fist or an object, kicking, dragging on the floor, strangling, burning, attacking with a knife, a firearm or any other weapon.

Sexual violence refers to any conduct of a sexual nature that abuses, humiliates, degrades or otherwise violate the dignity of a person. The acts that were asked in the questions included sexual violence through threats, intimidation or by any forceful method, including physical, which a woman did not consent to.

Emotional violence refers to a pattern of degrading and humiliating conducts towards a person in a manner to intimidate or harass under threats, verbal abuse, or constant humiliation. The questions asked on emotional violence included whether the woman was humiliated either verbally or physically in front of other people; threatened to hurt or do harm to the woman or to someone close to her or even insulting or belittling her.

All survey team members, including other key survey personnel, both male and female field staff, received an overview of the objectives of the module and why special measures must be adopted.

Only female interviewers and team leaders comprised of both males and females, received in-depth training for three days on security measures covering the following:

¹⁵⁶See: <https://www.dhsprogram.com/publications/publication-dhsqm-dhs-questionnaires-and-manuals.cfm>

¹⁵⁷A protection protocol/support plan for the survey was developed in line with the ethical and safety recommendations that were developed for the WHO Multi-country Study methodology on "Women's Health and Domestic Violence against Women". [add the link here to the document with the (approximate) title 'putting women first. Ethical and safety recommendations for researching violence against women']

- a) Obtaining consent specifically for the domestic violence module;
- b) Knowing different techniques to use in order to ask questions in a sensible way (keeping in mind the potential negative impact of the questions on the interviewee);
- c) Strategies to ensure privacy and confidentiality (conducting the interview in a private space/location and sensibly manage interruptions);
- d) How to refer any interviewee who is at risk to support services; and
- e) How to emotionally prepare oneself for this work (training included discussion to ensure data collectors' own perceptions and attitudes towards domestic violence do not influence the results).

A referral checklist was used at the end of each domestic violence interview to ensure appropriate support was provided to the interviewee. These measures were put in place to ensure women's safety and the ethical implementation of the domestic violence module, and at maximizing the disclosure of actual violence.

12.2 CHARACTERISTICS OF THE RESPONDENTS TO THE DV MODULE

Table DV1.0 presents the characteristics of respondents to the DV module. A total of 1,773 women were interviewed for DV module, of which 1,211 are, or ever were, married or who are, or ever have been, living with a man in an intimate relationship.

12.3 EXPERIENCES OF PHYSICAL AND SEXUAL VIOLENCE

Table DV.1.1 presents the percentage of women age 15-49 who have ever experienced physical violence since the age of 15 and experience of physical violence in the 12-month period before the survey by any perpetrator, and by a non-partner is presented in Table DV.1.1a. Table DV1.2 shows the perpetrators of the physical violence according to the women's marital status while physical violence by a non-partner is presented in Table DV.1.2a.

Table DV.1.3 and Table DV.1.3a presents the women's experience of sexual violence by any perpetrator and by a non-partner. The tables show the proportion of women age 15-49 who have experienced sexual violence at any point, since the age of 15 and those who experienced that type of violence in the last 12 months. Similarly, Table DV1.4 shows only the responses of the survivors of sexual violence by the perpetrators of the acts according to the marital status of the women respondent.

Table DV.1.5 shows the percentage of women age 15-49 years who experienced sexual violence by specific exact ages at which they first experienced such violence. This is according to current age and marital status.

Table DV.1.6 and DV1.6a exposes experiences of different forms of violence according to actual age, represented by age groups, of women. The different forms of violence include both physical and sexual from any perpetrator and non-partner respectively.

Table DV.1.7 shows women age 15-49 years who have ever been pregnant and experienced physical violence during pregnancy.

Table DV.1.1: Experience of physical violence by any perpetrator

12.4 SPOUSAL VIOLENCE

For the purpose of the Tonga MICS 2019, spousal violence is limited to emotional, physical and sexual violence perpetrated by a current or former husband or cohabiting partner against a woman who has ever been married or lived with a man in an intimate relationship. Thus, violence at the hands of the former husband, ex-partner or a deceased husband is also included. While a woman may be victim of only one form of violence, many forms can exist simultaneously. In majority of the cases, spousal violence is perpetrated by the men against the women, even when the women can also be violent against men which is also measured in this survey.

Table DV1.8 shows the percentage of ever-married women age 15-49, whose husbands/partners have ever demonstrated specific types of controlling behaviors. This is according to background characteristics.

Table DV1.9 shows various detailed forms of spousal violence experienced by ever-married women age 15-49. This spousal violence is broken down by acts involving physical, sexual and emotional committed by the current or former husband in the last 12 months and at any point in her lifetime.

Table DV2.0 presents a combination of emotional, physical and/or sexual spousal violence inclusively or exclusively according to socio-economic demographics.

Table DV2.1 report lifetime experience of spousal violence. This is according to characteristics of the husband and women empowerment indicators such as literacy level and age difference between the husband and the wife, as well as the fear of the husband or partner.

Table DV2.2 presents the percentage of ever-married women age 15-49 who have experienced emotional, physical and sexual violence by either the husband or partner, in the past 12 months according to background characteristics.

Table DV2.3 presents the first act of spousal violence by duration of marriage among women age 15- 49 who are currently married and have not been in any other marriage.

Table DV2.4 shows results for all women age 15-49 who have been married and experienced violence committed by the current or most recent husband/partner by types of injuries and type of violence experienced.

Table DV2.5 refers to violence committed by a woman age 15-49 against her husband or intimate partner at any point or in the last 12 months before the survey, even though the spouse or intimate partner of that woman did not beat her and was not physically aggressive towards her. The data in Table DV2.5 is segregated according to the characteristics of the woman, while Table DV2.6 shows violence, according to characteristics of the husband or partner.

Table DV.1.8: Marital control exercised by husbands

		Percentage of women whose husband/partner have ever demonstrated specific types of controlling behaviors, by background characteristics, Tonga MICS, 2019								
		Percentage of women whose husband/partner:								
		Is jealous or angry if she talks to other men ¹	Frequently accuses her of being unfaithful ²	Does not permit her to meet her female friends ³	Tries to limit her contact with her family ⁴	Insists on knowing where she is at all times ⁵	Does not allow her to join any social functions ⁶	Displays more than three controlling behaviour	Displays any controlling behaviour	Number of ever-married women

APPENDIX A SAMPLE DESIGN

The major features of the sample design are described in this appendix. Sample design features include defining the sampling frame, target sample size, sample allocation, listing in sample clusters, choice of domains, sampling stages, stratification, and the calculation of sample weights.

The primary objective of the sample design for the Tonga MICS was to produce statistically reliable estimates of most indicators, at the national level, for urban and rural areas, and for the five divisions of the country: Tongatapu, Vavaú, Haápai, 'Eua and Ongo Niua. Urban and rural areas in each of the five divisions were defined as the sampling strata. In designing the sample for the Tonga MICS, it was useful to review the sample design and results of the Demographic and Health Survey conducted in 2012, documented in the Final Report of that survey.

A multi-stage, stratified cluster sampling approach was used for the selection of the survey sample. The sampling frame was based on the 2016 Tonga Census of Population and Housing. The primary sampling units (PSUs) selected at the first stage were the enumeration areas (EAs) defined for the census enumeration. A listing of households was conducted in each sample EA, and a sample of households was selected at the second stage.

A.1 SAMPLE SIZE AND SAMPLE ALLOCATION

Since the overall sample size for the Tonga MICS partly depends on the geographic domains of analysis that are defined for the survey tables, the distribution of EAs and households in Tonga from the 2016 Census sampling frame was first examined by division, urban and rural strata, shown in Table SD.1.

Table SD.1: Distribution of Enumeration Areas and households in sampling frame						
Distribution of EAs and households, by division, urban and rural strata, Census 2016						
	Number of EAs			Number of Households (2016 Census)		
	Total	Urban	Rural	Total	Urban	Rural
Total	566	108	458	18,005	4,089	13,916
Division						
Tongatapu	368	108	260	12,953	4,089	8,864
Vavaú	104	-	104	2,715	-	2,715
Haápai	49	-	49	1,179	-	1,179
'Eua	29	-	29	885	-	885
Ongo Niua	16	-	16	273	-	273

The overall sample size for the Tonga MICS was calculated as 2,750 households. For the calculation of the sample size, the key indicator used was use of any contraceptive method for women aged 15-49 years. Since the survey results are tabulated at the divisional level, it was necessary to determine the minimum sample size for each division. The following formula was used to estimate the required sample size for this indicator:

$$n = \frac{[4(r)(1 - r)(deff)]}{[(RME \times r)^2(pb)(AveSize)(RR)]}$$

where:

- n = the required sample size, expressed as number of households
- 4 = a factor to achieve the 95 percent level of confidence
- r = the predicted or anticipated value of the indicator, expressed in the form of a proportion
- $deff$ = the design effect for the indicator, estimated from a previous survey or using a default value of 1.5
- RME = the relative margin of error of r to be tolerated at the 95 percent level of confidence; it is generally not more than 0.12 (12 percent) for national-level estimates
- pb = the proportion of the total population upon which the indicator, r , is based
- $AveSize$ = the average household size (mean number of persons per household)
- RR = the predicted response rate

For the calculation, r (the prevalence of women who use any contraceptive) was assumed to be 20 percent based on the national estimate from the 2012 DHS. The value of $deff$ (design effect) was taken as 1.8 based on the estimate from the 2012 DHS, pb (percentage of women age 15-49 years in the total population) was taken as 13 percent, $AveSize$ (mean household size) was taken as 5.4 households, and the response rate was assumed to be 99 percent, based on experience from the 2012 DHS. Although an RME of 12% is needed for the national-level estimates, for the divisional-level estimates it was sufficient to use an RME of 15% (that is, a margin of error of 0.15 r). Therefore, the total sample size at the national level was 2,780 households, with sample sizes in the divisions varying between 200 to 720 household.

The number of households selected per cluster for the Tonga MICS was determined as 20 households, based on several considerations, including the design effect, the budget available, and the time that would be needed per team to complete one cluster. Dividing the total number of households by the number of sample households per cluster, it was calculated that 139 sample clusters would need to be selected in each division.

Table SD.2 shows the allocation of the clusters and households to the sampling strata. The allocation was roughly equal over the divisions except for a somewhat larger sample in Tongatapu urban. The sample sizes were then corrected for very small population in some of the divisions with the use of the finite population correction factor (fpc). The total number of households does not add up to the planned sample size of 2,780 households because some of the selected clusters had less than 20 households.

Table SD.2: Sample allocation

Allocation of sample clusters (EAs) and sample households to sampling strata, Tonga MICS							
	Sample Clusters			Sample Households			
	Total	Urban	Rural	Total	Urban	Rural	
Total	139	36	103	2,751	719	2,031	
Division							
Tongatapu	63	36	27	1,256	719	537	
Vavaú	27	-	27	539	-	539	
Haápai	21	-	21	413	-	413	
'Eua	18	-	18	360	-	360	
Ongo Niua	10	-	10	183	-	183	

A.2 SELECTION OF ENUMERATION AREAS (CLUSTERS)

Census enumeration areas were selected from each of the sampling strata by using systematic probability proportional to size (pps) sampling procedures, based on the number of households in each enumeration area from the 2016 Census frame. The first stage of sampling was thus completed by selecting the required number of sample EAs (specified in Table SD.2) from each of the five divisions, separately for the urban and rural strata.

A.3 LISTING ACTIVITIES

Given that there had been many changes in the households enumerated in the 2016 Census, a new listing of households was conducted in all the sample enumeration areas prior to the selection of households. For this purpose, listing teams were trained to visit all the selected enumeration areas and list all households in each enumeration area.

The Mapping and Household Listing training and pilot for Tonga MICS 2019 took place from 5 – 7 June 2019. Tonga Statistics Department (TSD) recruited 42 persons (37 women and 5 men) to serve as listers/mappers and supervisors during the household listing operation. Of these 22 were recruited from main island TongaTapu, 8 came from Vava'u Island, 6 came from Ha'apai Island and 6 from Eua Island. Three TDS staff facilitated the training and were being supported by the UNICEF Monitoring and Evaluation (MICS) Specialist

The fieldwork for Mapping and Household listing operation began on 10 June 2019 and lasted for 2 weeks. It was carried out by 15 teams: each team consisted of one mapper and one lister. In addition, Tonga SD placed one Household Listing supervisor for every two teams to be responsible for the overall support and supervision of the household listing activities during the fieldwork. The household listing operation involved three main activities: locating each selected cluster/enumeration area (EA), preparing the sketch map of each cluster (and base map if needed), and listing all structures, units and households found in each cluster. This list then served as a sampling frame for the final selection of households to be included in the 2019 Tonga MICS sample. During the listing, a total 4 enumeration areas (EAs) with very few households (less than 17 households) were combined with one of the neighbouring EA, not previously selected in sample. Four EAs from Ongo Niua division could not be reached during listing fieldwork. In these cases, old household lists from 2016 Census were used.

A.4 SELECTION OF HOUSEHOLDS

Lists of households were prepared by the listing teams in the field for each enumeration area. The households were then sequentially numbered from 1 to Mhi (the total number of households in each enumeration area) at the Tonga Statistics Department Office, where the selection of 20 households in each enumeration area was carried out using random systematic selection procedures. The MICS6 spreadsheet template for systematic random selection of households was adapted for this purpose.¹⁵⁸

The survey also included a questionnaire for individual men that was to be administered in half of the sample of households. The MICS household selection template includes an option to specify the proportion of households to be selected for administering the individual questionnaire for men, and the spreadsheet automatically selected the corresponding subsample of households.¹ All men age 15 to 49 years in the selected households were eligible for interview.

The Tonga MICS also included water quality testing for a subsample of households within each sample cluster. A subsample of 5 of the 20 selected households was selected in each sample cluster using random systematic sampling for conducting water quality testing, for both water in the household and at the source. The MICS household selection template includes an option to specify the number of households to be selected for the water quality testing, and the spreadsheet automatically selected the corresponding subsample of households.¹

A standard quality control measure was implemented through blank testing (a test of uncontaminated water) to assess whether teams were correctly performing the water testing procedure. One blank test was assigned to each cluster, but for practical purposes relating to data capture, this was assigned to the first household number selected for water quality testing.

A.5 CALCULATION OF SAMPLE WEIGHTS

The Tonga MICS sample is not self-weighting. Different sampling fractions were used in each division. For this reason, sample weights were calculated and used in the subsequent analyses of the survey data.

The major component of the weight is the reciprocal of the sampling fraction employed in selecting the number of sample households in that particular sampling stratum (h) and PSU (i):

$$W_{hi} = \frac{1}{f_{hi}}$$

The term f_{hi} , the sampling probability for the i -th sample PSU in the h -th stratum, is the product of the probabilities of selection at every stage in each sampling stratum:

$$f_{hi} = p_{1hi} \times p_{2hi} \times p_{3hi}$$

where $p_{s hi}$ is the probability of selection of the sampling unit at stage s for the i -th sample PSU in the h -th sampling stratum. Based on the sample design, these probabilities were calculated as follows:

¹⁵⁸ Available here: "MICS6 TOOLS." Home - UNICEF MICS. Accessed August 31, 2018. <http://mics.unicef.org/tools#survey-design>.

$$p_{1hi} = \frac{n_h \times M_{hi}}{M_h}$$

n_h = number of sample PSUs selected in stratum h

M_{hi} = number of households in the 2016 Census frame for the i -th sample PSU in stratum h

M_h = total number of households in the 2016 Census frame for stratum h

p_{2hi} = proportion of the PSU listed in the i -th sample PSU in stratum h (in the case of PSUs that were segmented); for non-segmented PSUs, $p_{2hi} = 1$

$$p_{3hi} = \frac{20}{M'_{hi}}$$

M'_{hi} = number of households listed in the i -th sample PSU in stratum h

Since the number of households in each enumeration area (PSU) from the 2016 Census frame used for the first stage selection and the updated number of households in the EA from the listing are generally different, individual overall probabilities of selection for households in each sample EA (cluster) were calculated.

A final component in the calculation of sample weights takes into account the level of non-response for the household and individual interviews. The adjustment for household non-response in each stratum is equal to:

$$\frac{1}{RR_h}$$

where RR_h is the response rate for the sample households in stratum h , defined as the proportion of the number of interviewed households in stratum h out of the number of selected households found to be occupied during the fieldwork in stratum h .

Similarly, adjustment for non-response at the individual level (women, men, and under-5 children) for each stratum is equal to:

$$\frac{1}{RR_{qh}}$$

where RR_{qh} is the response rate for the individual questionnaires in stratum h , defined as the proportion of eligible individuals (women, men, and under-5 children) in the sample households in stratum h who were successfully interviewed.

After the completion of fieldwork, response rates were calculated for each sampling stratum. These were used to adjust the sample weights calculated for each cluster. Response rates in the Tonga MICS are shown in Table SR.1.1 in this report.

The non-response adjustment factors for the individual women and under-5 questionnaires were applied to the adjusted household weights. Numbers of eligible women and under-5 children were obtained from the list of household members in the Household Questionnaire for households where interviews were completed.

The weights for the questionnaire for individual men were calculated in a similar way. In this case the number of eligible men in the list of household members in all the MICS sample households in the stratum was used as the numerator of the non-response adjustment factor, while the number of completed questionnaires for men in the stratum was obtained from the 50% subsample of households. Therefore, this adjustment factor includes an implicit subsampling weighting factor of 2 in addition to the adjustment for the non-response to the individual questionnaire for men.

In the case of the questionnaire for children age 5-17 years, in each sample household, one child was randomly selected from all the children in this age group recorded in the list of household members. The household weight for the children age 5-17 years is first adjusted based on the response rate for this questionnaire at the stratum level. Once this adjusted household weight is normalised as described below, it is multiplied by the number of children age 5-17 years recorded in the list of household members. Therefore, the weights for the individual children age 5-17 years will vary by sample household. This weighting of the data for the children age 5-17 years old is implemented in the tabulation programs for the corresponding tables.

For the water quality testing (both in household and at source) a subsample of 5 households was selected from the 20 MICS sample households in each sample cluster. Therefore, the basic (unadjusted) household weight would be multiplied by the inverse of this subsampling rate as follows:

$$W_{wqhi} = \frac{1}{f_{hi}} \times \frac{20}{5} = \frac{4}{f_{hi}}$$

where:

W_{wqhi} = basic weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h

Since the response rate may be different for the water quality testing for home consumption and at the source, the basic weights for each were adjusted separately for non-response at the stratum level as follows:

$$W'_{wqhi} = W_{wqhi} \times \frac{m_{wqh}}{m'_{wqh}}$$

where:

W'_{wqhi} = adjusted weight for the subsample of households selected for the water quality testing in the i -th sample EA in stratum h (separately for water quality testing in the household and at the source)

m_{wqh} = number of valid (occupied) sample households selected for water quality testing in stratum h

m'_{wqh} = number of sample households with completed water quality testing in stratum h (separately for water quality testing in the household and at the source)

The Tonga MICS full (raw) weights for the households were calculated by multiplying the inverse of the probabilities of selection by the non-response adjustment factor for each stratum. These weights were then standardised (or normalised), one purpose of which is to make the weighted sum of the interviewed sample units equal to the total sample size at the national level. Normalisation is achieved by dividing the full sample weights (adjusted for nonresponse) by the average of these weights across all households at the national level. This is performed by multiplying the sample weights by a constant factor equal to the unweighted number of households at the national level divided by the weighted total number of households (using the full sample weights adjusted for non-response). A similar standardisation procedure was followed in obtaining standardised weights for the individual women, men, under-5 questionnaires and water quality testing. Adjusted (normalised) household weights varied between 0.177866 and 4.930188 in the 139 sample enumeration areas (clusters).

Sample weights were appended to all data sets and analyses were performed by weighting the data for households, women, men, under-5s, 5-17-year olds and water quality testing with these sample weights.

APPENDIX C ESTIMATES OF SAMPLING ERRORS

The sample of respondents selected in the Tonga MICS 2019 Multiple Indicator Cluster Survey is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly but can be estimated statistically from the survey data.

The following sampling error measures are presented in this appendix for each of the selected indicators:

- **Standard error (se):** Standard error is the square root of the variance of the estimate. For survey indicators that are means, proportions or ratios, the Taylor series linearization method is used for the estimation of standard errors. For more complex statistics, such as fertility and mortality rates, the Jackknife repeated replication method is used for standard error estimation.
- **Coefficient of variation (se/r)** is the ratio of the standard error to the value (r) of the indicator and is a measure of the relative sampling error.
- **Design effect (deft)** is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling based on the same sample size. The square root of the design effect (deft) is used to show the efficiency of the sample design in relation to the precision. A deft value of 1.0 indicates that the sample design of the survey is as efficient as a simple random sample for a particular indicator, while a deft value above 1.0 indicates an increase in the standard error due to the use of a more complex sample design. Confidence limits are calculated to show the interval which contains the true value of the indicator for the population, with a specified level of confidence. For MICS results 95% confidence intervals are used, which is the standard for this type of survey. The concept of the 95% confidence interval can be understood in this way: if many repeated samples of identical size and design were taken and the confidence interval computed for each sample, then 95% of these intervals would contain the true value of the indicator.

For the calculation of sampling errors from MICS data, programs developed in CSPro Version 5.0 and SPSS Version 24 Complex Samples module have been used.

The results are shown in the tables that follow. Sampling errors are calculated for SDG indicators for which SEs can be calculated, and several other MICS indicators. Definitions, numerators and denominators of each of these indicators are provided in Chapter III. Results are presented for the national level (Table SE.1), for urban and rural areas (Tables SE.2 and SE.3), and for all divisions (Tables SE.4 to SE.8).

In addition to the sampling error measures described above, the tables also include weighted and unweighted counts of denominators for each indicator. Given the use of normalized weights, by comparing the weighted and unweighted counts it is possible to determine whether a particular domain has been under-sampled or over-sampled compared to the average sampling rate. If the weighted count is smaller than the unweighted count, this means that the domain had been over-sampled.

For several indicators, however, the unweighted count represents the number of sample households, and the weighted counts reflect the total population living in these households.

- Access to electricity
- Primary reliance on clean fuels and technologies for cooking, space heating and lighting
- Use of basic drinking water services
- Use of safely managed drinking water services
- Handwashing facility with water and soap
- Use of basic sanitation services
- Safe disposal in situ of excreta from on-site sanitation facilities
- Population covered by social transfers

Table SE.1: Sampling errors: Total sampleStandard errors, coefficients of variation, design effects (deff), square root of design effects (deff), and confidence intervals for selected SDG and MICS indicators, Tonga MICS, 2019

	MICS Indicator	Value (r)	Standard error ($s_e(r)$)	Coefficient of variation effect (seff/r)	Design effect (deff)	Square root of design effect (deff)	Confidence limits

44	71	1.1	60	0.9	Total	6,486	100.0	6,746	100.0

^a As this table includes all household members listed in interviewed households, the numbers and distributions by sex do not match those shown for individuals in Tables SR.5.1W/M, SR.5.2 and SR.5.3 where interviewed individuals are weighted with individual sample weights. Tables DQ.1.2W/M, DQ.1.3 and DQ.1.4 similarly use household sample weights and do not match distributions obtained through individual questionnaires.

Table DQ.1.2W: Age distribution of eligible and interviewed women

Household population of women age 10-54 years, interviewed women age 15-49 years, and percentage of eligible women who were interviewed, by five-year age groups, Tonga MICS, 2019

	Household population of women age 10-54 years	Interviewed women age 15-49 years		Percentage of eligible women interviewed (Completion rate)

^a Includes those households in which the first test indicated no reaction (not iodised) where a second test was not performed**Table DQ.3.2: Completeness and quality of information of water quality testing**

Percentage of households selected for and with complete water quality testing at household and source and percentage of positive blank tests, Tonga MICS, 2019

	Percentage of households:			Percentage of households with complete water quality test for:			Number of households selected for Water Quality Testing Questionnaire	Number of blank tests completed	Number of households selected for blank test ^a
	Selected for Water Quality Testing questionnaire	With Water Quality Testing questionnaire	Total number of households in sample	Household drinking water	Source of drinking water	Water Quality Testing Questionnaire			
Total	25.2	24.6	24.5	20.8	2,498	0.3	121	128	
Area									
Urban	26.0	25.0	25.0	20.5	570	0.0	24	29	
Rural	24.9	24.5	24.4	20.8	1,928	0.3	97	99	

^a One blank test (a test of uncontaminated water) was designed to be performed in each cluster. For practical reasons, the blank test was assigned to one of the households selected for water quality testing.

Table DQ.3.3W: Completeness of information on dates of marriage/union and sexual intercourse (women)

Percentage of women age 15-49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Tonga MICS, 2019

	Percent with missing/ incomplete information ^A	Number of women
Ever married (age 15-49 years)		
Date of first marriage/union missing	9.9	1,768
Only month missing	4.8	1,768
Both month and year missing	3.8	1,768
Age at first marriage/union missing	0.9	1,768
Ever had sex (age 15-49 years)		
Age at first intercourse missing	3.1	1,889
Time since last intercourse missing	4.3	1,889
Ever had sex (age 15-24 years)		
Age at first intercourse missing	15.0	276
Time since last intercourse missing	15.6	276

^A Includes "Don't know" responses

Table DQ.3.3M: Completeness of information on dates of marriage/union and sexual intercourse (men)

Percentage of men age 15-49 years with missing or incomplete information on date of and age at first marriage/union and age at first intercourse and time since last intercourse, Tonga MICS, 2019

	Percent with missing/ incomplete information ^A	Number of men
Ever married (age 15-49 years)		
Date of first marriage/union missing	17.4	668
Only month missing	12.6	668
Both month and year missing	4.7	668
Age at first marriage/union missing	2.6	668
Ever had sex (age 15-49 years)		
Age at first intercourse missing	3.4	827
Time since last intercourse missing	5.3	827
Ever had sex (age 15-24 years)		
Age at first intercourse missing	13.5	167
Time since last intercourse missing	16.6	167

^A Includes "Don't know" responses

Table DQ.3.4: Completeness of information for anthropometric indicators: Underweight

Percent distribution of children under 5 by completeness of information on date of birth and weight, Tonga MICS, 2019

	Valid weight and date of birth	Reason for exclusion from analysis				Percent of children excluded from analysis	Number of children under 5

APPENDIX E TONGA MICS 2019 QUESTIONNAIRES

The questionnaires of the Tonga MICS 2019 are presented in Appendix E:

- Household questionnaire
- Water Quality Testing Questionnaire
- Questionnaire for Individual Women
- Questionnaire for Individual Men
- Questionnaire for Children Under Five
- Questionnaire Form for Vaccination Records at Health Facility
- Questionnaire for Children Age 5-17

HOUSEHOLD QUESTIONNAIRE
Tonga Multiple Indicator Cluster Survey 2019

HOUSEHOLD INFORMATION PANEL		HH
HH1. Cluster number:		HH2. Household number:
HH3. Interviewer's name and number: NAME _____		HH4. Supervisor's name and number: NAME _____
HH5. Day / Month / Year of interview: _____/_____/2_0_1		HH7. ISLAND DIVISION:
HH6. AREA:		TONGATAPU 1 VAVA'U 2 HA'APAI 3 'EUA 4 ONGO NIUA 5
HH8. Is the household selected for Questionnaire for Men?	YES 1 NO 2	HH10. Is the household selected for Water Quality Testing?
HH9. Is the household selected for Water Quality Testing?	YES 1 NO 2	YES 1 NO 2

<i>Check that the respondent is a knowledgeable member of the household and at least 18 years old before proceeding. You may only interview a child age 15-17 if there is no adult member of the household or all adult members are incapacitated. You may not interview a child under age 15.</i>	HH11. Record the time.
	HOURS : MINUTES _____
HH12. Hello, my name is (<i>your name</i>). We are from TONGA STATISTICS DEPARTMENT OFFICE . We are conducting a survey about the situation of children, families and households. I would like to talk to you about these subjects. This interview usually takes about 40 minutes. Following this, I may ask to conduct additional interviews with you or other individual members of your household. All the information we obtain will remain strictly confidential and anonymous. If you do not wish to answer a question or stop the interview, please let me know. May I start now?	
YES 1 NO / NOT ASKED 2	1 ↳ LIST OF HOUSEHOLD MEMBERS 2 ↳ HH46

HH46. Result of Household Questionnaire interview:	COMPLETED 01 NO HOUSEHOLD MEMBER AT HOME OR NO COMPETENT RESPONDENT AT HOME AT TIME OF VISIT 02 ENTIRE HOUSEHOLD ABSENT FOR EXTENDED PERIOD OF TIME 03 REFUSED 04 DWELLING VACANT OR ADDRESS NOT A DWELLING 05 DWELLING DESTROYED 06 DWELLING NOT FOUND 07 OTHER (specify) 96
<i>Discuss any result not completed with Supervisor.</i>	

HH47. Name and line number of the respondent to Household Questionnaire interview: NAME _____	To be filled after the Household Questionnaire is completed	To be filled after all the questionnaires are completed
HOUSEHOLD MEMBERS	TOTAL NUMBER	
WOMEN AGE 15-49	HH48	---
If household is selected for Questionnaire for Men: MEN AGE 15-49	HH49	---
CHILDREN UNDER AGE 5	HH50	---
CHILDREN AGE 5-17	HH51	---
	HH52	---
		ZERO 0 ONE 1

First complete HL2-HL4 vertically for all household members, starting with the head of the household. Once HL2-HL4 are complete for all members (such as servants, friends) but who usually live in the household, then, ask questions HL5-HL20 for each member one at a time. If additional questionnaires are used, indicate by ticking this box.....

Those that are not currently at home, any infants or small children and any others who may not be family (such as servants, friends) but who usually live in the household.

HL1. HL2. First, please tell me the name of each person who usually lives here, starting with the head of the household. <i>Probe for additional household members:</i>	HL3. HL4. What is the relationship of (name) to (name) of the head of household? 1 MALE 2 FEMALE	HL5. What is (name)'s date of birth? HL6. How old is (name)? HL7. Record line number of woman if man, and age 15-49, 49 and over. HL8. Record in complete d.years. <i>If age is 92 or above, record 95*.</i>	HL9. Record line number of woman if man, and age 15-49 and over. HL10. Is (name)'s natural mother alive? HL11. Age of (name) if man, and age 15-49, 49 and over. HL12. Record line number of woman if man, and age 15-49 and over. HL13. Does (name)'s natural mother live in this household? HL14. Record the line number of mother and go to HL16.	HL15. Where does (name)'s natural mother live? HL16. Is (name)'s natural father alive? HL17. Does (name)'s natural father live in this household? HL18. Record the line number of father and go to HL20.	HL19. Where does (name)'s natural father live? HL20. Copy the line number of mother from HL14. If blank, ask: Who is the primary caretaker of (name)?

7	1	3	3	5	1	5	3
8	2	1	4	1	2	6	4
9	1	2	1	2	3	7	5

HH26. Record the rank number (HH20), line number (HH21), name (HH22) and age (HH24) of the selected child.

RANK NUMBER

LINE NUMBER

HH27. (When HH18=1 or when there is a single child age 5-17 in the household):

Record the rank number as '1' and record the line number (HL1), the name (HL2) and age (HL6) of this child from the LIST OF HOUSEHOLD MEMBERS.

NAME

AGE

HH28. Issue a QUESTIONNAIRE FOR CHILDREN AGE 5-17 to be administered to the mother/caretaker of this child.

HH29. Check HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any women age 15-49?	YES, AT LEAST ONE WOMAN AGE 15-49 1 NO..... 2	2⇒HH34
--	--	--------

HH30. Issue a separate QUESTIONNAIRE FOR INDIVIDUAL WOMEN for each woman age 15-49 years.

HH30A . CHECK HL8 IN THE LIST OF HOUSEHOLD MEMBERS: ARE THERE ANY WOMEN AGE 15-49?	1 YES, AT LEAST ONE WOMAN AGE 15-49 ... 1 2 OR MORE WOMEN (NUMBER).....	1⇒HH30I
---	--	---------

HH31. Check HL6 and HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any girls age 15-17?	YES, AT LEAST ONE GIRL AGE 15-17 1 NO 2	2⇒HH34
HH32. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one girl age 15-17?	YES, AT LEAST ONE GIRL AGE 15-17 WITH HL20≠90 1 NO, HL20=90 FOR ALL GIRLS AGE 15-17 2	2⇒HH34
HH33. As part of the survey we are also interviewing women age 15-49. We ask each person we interview for permission. A female interviewer conducts these interviews.		
For girls age 15-17 we must also get permission from an adult to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.		
May we interview (<i>name(s) of female member(s) age 15-17</i>) later?		
<input type="checkbox"/> 'Yes' for all girls age 15-17 ⇒ Continue with HH34. <input type="checkbox"/> 'No' for at least one girl age 15-17 and 'Yes' to at least one girl age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those adult consent was not given. Then continue with HH34. <input type="checkbox"/> 'No' for all girls age 15-17 ⇒ Record '06' in WM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom adult consent was not given. Then continue with HH34.		
HH34. CHECK HH8 IN THE HOUSEHOLD INFORMATION PANEL: IS THE HOUSEHOLD SELECTED FOR QUESTIONNAIRE FOR MEN?	YES, HH8=1 1 NO, HH8=2 2	2⇒HH40
HH35. Check HL9 in the LIST OF HOUSEHOLD MEMBERS: Are there any men age 15-49?	YES, AT LEAST ONE MAN AGE 15-49 1 NO 2	2⇒HH40
HH36. Issue a separate QUESTIONNAIRE FOR INDIVIDUAL MEN for each man age 15-49 years.		
HH37. Check HL6 and HL8 in the LIST OF HOUSEHOLD MEMBERS: Are there any boys age 15-17?	YES, AT LEAST ONE BOY AGE 15-17 1 NO 2	2⇒HH40
HH38. Check HL20 in the LIST OF HOUSEHOLD MEMBERS: Is consent required for interviewing at least one boy age 15-17?	YES, AT LEAST ONE BOY AGE 15-17 WITH HL20≠90 1 NO, HL20=90 FOR ALL BOYS AGE 15-17 2	2⇒HH40
HH39. As part of the survey we are also interviewing men age 15-49. We ask each person we interview for permission. A male interviewer conducts these interviews.		
For boys age 15-17 we must also get permission from an adult to interview them. As mentioned before, all the information we obtain will remain strictly confidential and anonymous.		
May we interview (<i>name(s) of male member(s) age 15-17</i>) later?		
<input type="checkbox"/> 'Yes' for all boys age 15-17 ⇒ Continue with HH40. <input type="checkbox"/> 'No' for at least one boy age 15-17 and 'Yes' to at least one boy age 15-17 ⇒ Record '06' in MWM17 (also in UF17 and FS17, if applicable) on individual questionnaires for those adult consent was not given. Then continue with HH40. <input type="checkbox"/> 'No' for all boys age 15-17 ⇒ Record '06' in MWM17 (also in UF17 and FS17, if applicable) on all individual questionnaires for whom adult consent was not given. Then continue with HH40.		
HH40. Check HL10 in the LIST OF HOUSEHOLD MEMBERS: Are there any children age 0-4?	YES, AT LEAST ONE 1 NO 2	2⇒HH42

HH41. Issue a separate QUESTIONNAIRE FOR CHILDREN UNDER FIVE for each child age 0-4 years.		
HH42. CHECK HH9 IN THE HOUSEHOLD INFORMATION PANEL: IS THE HOUSEHOLD SELECTED FOR WATER QUALITY TESTING QUESTIONNAIRE?	YES, HH9=1 NO, HH9=2.....	.1 .2 2⇒HH45
HH43. Issue a separate WATER QUALITY TESTING QUESTIONNAIRE for this household		
HH44. As part of the survey we are also looking at the quality of drinking water. We would like to do a simple test of your drinking water. A colleague will come and collect the water samples. May we do such a test? <i>If the respondent requests to learn the results, explain that results will not be shared with individual households but will be made available to local authorities.</i>	YES, PERMISSION IS GIVEN NO, PERMISSION IS NOT GIVEN1 .2 2⇒Record '02' in WQ31 on the WATER QUALITY TESTING QUESTIONNAIRE
HH45. Now return to the HOUSEHOLD INFORMATION PANEL and,		
<ul style="list-style-type: none"> • Record '01' in question HH46 (Result of the Household Questionnaire interview), • Record the name and the line number (from the LIST OF HOUSEHOLD MEMBERS) of the Respondent to the Household Questionnaire interview in HH47, • Fill the questions HH48 – HH52, • Thank the respondent for his/her cooperation and then • Proceed with the administration of the remaining individual questionnaire(s) in this household. 		
<i>If there is no individual questionnaire and no WATER QUALITY TESTING QUESTIONNAIRE to be completed in this household thank the respondent for his/her cooperation and move to the next household you have been assigned by your supervisor.</i>

WM3. Woman's name and line number: NAME _____	WM4. Supervisor's name and number: NAME _____	
WM5. Interviewer's name and number: NAME _____	WM6. Day / Month / Year of interview: _____/_____/201_____	

<i>Check woman's age in HL6 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE: If age 15-17, verify in HH33 that adult consent for interview is obtained or not necessary (HL20=90). If consent is needed and not obtained, the interview must not commence and '06' should be recorded in WM17.</i>	WM7. Record the time:	
	HOURS : MINUTES ____ : ____	
WM8. Check completed questionnaires in this household: Have you or another member of your team interviewed this respondent for another questionnaire?	YES, INTERVIEWED ALREADY 1	1⇒WM9B
	NO, FIRST INTERVIEW 2	2⇒WM9A
WM9A. Hello, my name is (<i>your name</i>). We are from Tonga Statistics Department Office . We are conducting a survey about the situation of children, families and households. I would like to talk to you about your health and other topics. This interview usually takes about 50 minutes. We are also interviewing mothers about their children. All the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or wish to stop the interview, please let me know. May I start now?	WM9B. Now I would like to talk to you about your health and other topics in more detail. This interview will take about 50 minutes. Again, all the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or wish to stop the interview, please let me know. May I start now?	
Yes..... 1	1⇒WOMAN'S BACKGROUND Module	
No / NOT ASKED 2	2⇒WM17	

WM17. Result of woman's interview. Discuss any result not completed with Supervisor.	COMPLETED 01
	NOT AT HOME 02
	REFUSED 03
	PARTLY COMPLETED 04
	INCAPACITATED (<i>specify</i>) 05
	NO ADULT CONSENT FOR RESPONDENT AGE 15-17 06
	OTHER (<i>specify</i>) 96

WOMAN'S BACKGROUND			WB
WB1. Check the respondent's line number (WM3) in WOMAN'S INFORMATION PANEL and the respondent to the HOUSEHOLD QUESTIONNAIRE (HH47): Is this respondent also the respondent to Household Questionnaire?	YES, RESPONDENT IS THE SAME, WM3=HH47 NO, RESPONDENT IS NOT THE SAME, WM3≠HH47.....	1 2	2⇒WB3
WB2. Check ED5 in EDUCATION Module in the HOUSEHOLD QUESTIONNAIRE for this respondent: Highest level of school attended:	ED5=2, 3, 4 OR 5 ED5=0, 1, 8 OR BLANK.....	1 2	1⇒WB15 2⇒WB14
WB3. In what month and year were you born?	DATE OF BIRTH MONTH DK MONTH YEAR DK YEAR	— — — — 9998	
WB4. How old are you? <i>Probe:</i> How old were you at your last birthday? <i>If responses to WB3 and WB4 are inconsistent, probe further and correct. Age must be recorded.</i>	AGE (IN COMPLETED YEARS).....	— —	
WB5. Have you ever attended school or any early childhood education programme?	YES NO	1 2	2⇒WB14
WB6. What is the highest level and class/form or year of school you have attended?	EARLY CHILDHOOD EDUCATION PRIMARY LOWER SECONDARY UPPER SECONDARY TECHNICAL AND VOCATIONAL TERTIARY/UNIVERSITY	000 1 2 3 4 5	000⇒WB14
WB7. Did you complete that (class/form/year)?	YES NO	1 2	
WB8. Check WB4: Age of respondent:	AGE 15-24 AGE 25-49	1 2	2⇒WB13
WB9. At any time during the 2019 school year did you attend school?	YES NO	1 2	2⇒WB11
WB10. During 2019 school year, which level and class/form or year are you <u>attending</u> ?	PRIMARY LOWER SECONDARY UPPER SECONDARY TECHNICAL AND VOCATIONAL TERTIARY/UNIVERSITY	1 2 3 4 5	
WB11. At any time during the 2018 school year did you attend school?	YES NO	1 2	2⇒WB13

WB12. During 2018 school year, which level and class/form or year did you attend?	PRIMARY 1 LOWER SECONDARY 2 UPPER SECONDARY 3 TECHNICAL AND VOCATIONAL 4 TERTIARY/UNIVERSITY 5	
WB13. Check WB6: Highest level of school attended:	WB6=2, 3, 4 OR 5 1 WB6=1 2	1⇒WB15
WB14. Now I would like you to read this sentence to me. <i>Show sentence on the card to the respondent.</i> <i>If respondent cannot read whole sentence, probe: Can you read part of the sentence to me?</i>	CANNOT READ AT ALL 1 ABLE TO READ ONLY PARTS OF SENTENCE 2 ABLE TO READ WHOLE SENTENCE 3 NO SENTENCE IN REQUIRED LANGUAGE / BRAILLE (specify language) 4	
WB15. How long have you been continuously living in (name of current city, town or village of residence)? <i>If less than one year, record '00' years.</i>	YEARS ALWAYS / SINCE BIRTH 95	95⇒WB18
WB16. Just before you moved here, where did you live? <i>Probe to identify the type of place.</i> <i>If unable to determine whether the place is a city, a town or a rural area, write the name of the place and then temporarily record '5' until you learn the appropriate category for the response.</i> <i>(Name of place)</i>	CITY 1 URBAN AREA 2 RURAL AREA 3 UNABLE TO DETERMINE IF CITY/TOWN/RURAL 5 DK / DON'T REMEMBER 8	
WB17. Before you moved here, in which Island Division did you live in?	TONGATAPU 1 VAVA'U 2 HA'APAI 3 'EUA 4 ONGO NIUA 5 OUTSIDE OF TONGA (specify) 6	
WB18. Are you covered by any health insurance/social security?	YES 1 NO 2	2⇒End
WB19. What type of health insurance are you covered by? <i>Record all mentioned.</i>	HEALTH INSURANCE THROUGH EMPLOYER B SOCIAL SECURITY C OTHER PRIVATELY PURCHASED COMMERCIAL HEALTH INSURANCE D OTHER (specify) X	

MASS MEDIA AND ICT		MT
MT1. Do you read a newspaper or magazine at least once a week, less than once a week or not at all? <i>If 'At least once a week', probe:</i> Would you say this happens almost every day? <i>If 'Yes' record 3, if 'No' record 2.</i>	NOT AT ALL0 LESS THAN ONCE A WEEK1 AT LEAST ONCE A WEEK.....2 ALMOST EVERY DAY3	
MT2. Do you listen to the radio at least once a week, less than once a week or not at all? <i>If 'At least once a week', probe:</i> Would you say this happens almost every day? <i>If 'Yes' record 3, if 'No' record 2</i>	NOT AT ALL0 LESS THAN ONCE A WEEK1 AT LEAST ONCE A WEEK.....2 ALMOST EVERY DAY3	
MT3. Do you watch television at least once a week, less than once a week or not at all? <i>If 'At least once a week', probe:</i> Would you say this happens almost every day? <i>If 'Yes' record 3, if 'No' record 2</i>	NOT AT ALL0 LESS THAN ONCE A WEEK1 AT LEAST ONCE A WEEK.....2 ALMOST EVERY DAY3	
MT4. Have you ever used a computer or a tablet from any location?	YES1 NO.....2	2⇒MT9
MT5. During the last 3 months, did you use a computer or a tablet at least once a week, less than once a week or not at all? <i>If 'At least once a week', probe:</i> Would you say this happened almost every day? <i>If 'Yes' record 3, if 'No' record 2</i>	NOT AT ALL0 LESS THAN ONCE A WEEK1 AT LEAST ONCE A WEEK.....2 ALMOST EVERY DAY3	0⇒MT9

MT6. During the last 3 months, did you:		YES	NO	
[A] Copy or move a file or folder?	COPY/MOVE FILE	1	2	
[B] Use a copy and paste tool to duplicate or move information within a document?	USE COPY/PASTE IN DOCUMENT	1	2	
[C] Send e-mail with attached file, such as a document, picture or video?	SEND E-MAIL WITH ATTACHMENT	1	2	
[D] Use a basic arithmetic formula in a spreadsheet?	USE BASIC SPREADSHEET FORMULA .	1	2	
[E] Connect and install a new device, such as a modem, camera or printer?	CONNECT DEVICE	1	2	
[F] Find, download, install and configure software?	INSTALL SOFTWARE	1	2	
[G] Create an electronic presentation with presentation software, including text, images, sound, video or charts?	CREATE PRESENTATION	1	2	
[H] Transfer a file between a computer and other device?	TRANSFER FILE.....	1	2	
[I] Write a computer program in any programming language?	PROGRAMMING	1	2	
MT7. Check MT6[C]: Is 'Yes' recorded?	YES, MT6[C]=1	1		1⇒MT10
	NO, MT6[C]=2	2		
MT8. Check MT6 [F]: Is 'Yes' recorded?	YES, MT6[F]=1	1		1⇒MT10
	NO, MT6[F]=2.....	2		
MT9. Have you ever used the internet from any location and any device?	YES	1		
	NO	2		2⇒MT11
MT10. During the last 3 months, did you use the internet at least once a week, less than once a week or not at all? <i>If 'At least once a week', probe: Would you say this happens almost every day?</i>	NOT AT ALL	0		
	LESS THAN ONCE A WEEK.....	1		
	AT LEAST ONCE A WEEK	2		
	ALMOST EVERY DAY	3		
<i>If 'Yes' record 3, if 'No' record 2.</i>				
MT11. Do you own a mobile phone?	YES	1		
	NO	2		
MT12. During the last 3 months, did you use a mobile telephone at least once a week, less than once a week or not at all? <i>Probe if necessary: I mean have you communicated with someone using a mobile phone.</i>	NOT AT ALL	0		
	LESS THAN ONCE A WEEK.....	1		
	AT LEAST ONCE A WEEK	2		
	ALMOST EVERY DAY	3		
<i>If 'At least once a week', probe: Would you say this happens almost every day?</i>				
<i>If 'Yes' record 3, if 'No' record 2.</i>				

FERTILITY/BIRTH HISTORY		
		CM
CM1. Now I would like to ask about all the births you have had during your life. Have you ever given birth?	YES 1 NO 2	2⇒CM8
<i>This module and the birth history should only include children born alive. Any stillbirths should not be included in response to any question.</i>		
CM2. Do you have any sons or daughters to whom you have given birth who are now living with you?	YES 1 NO 2	2⇒CM5
CM3. How many sons live with you? <i>If none, record '00'.</i>	SONS AT HOME ____	
CM4. How many daughters live with you? <i>If none, record '00'.</i>	DAUGHTERS AT HOME ____	
CM5. Do you have any sons or daughters to whom you have given birth who are alive but do not live with you?	YES 1 NO 2	2⇒CM8
CM6. How many sons are alive but do not live with you? <i>If none, record '00'.</i>	SONS ELSEWHERE ____	
CM7. How many daughters are alive but do not live with you? <i>If none, record '00'.</i>	DAUGHTERS ELSEWHERE ____	
CM8. Have you ever given birth to a boy or girl who was born alive but later died? <i>If 'No' probe by asking: I mean, to any baby who cried, who made any movement, sound, or effort to breathe, or who showed any other signs of life even if for a very short time?</i>	YES 1 NO 2	2⇒CM11
CM9. How many boys have died? <i>If none, record '00'.</i>	BOYS DEAD ____	
CM10. How many girls have died? <i>If none, record '00'.</i>	GIRLS DEAD ____	
CM11. Sum answers to CM3, CM4, CM6, CM7, CM9 and CM10.	SUM ____	
CM12. Just to make sure that I have this right, you have had in total (total number in CM11) births during your life. Is this correct?	YES 1 NO 2	1⇒CM14
CM13. Check responses to CM1-CM10 and make corrections as necessary until response in CM12 is 'Yes'.		
CM14. Check CM11: How many live births?	NO LIVE BIRTHS, CM11=00 0 ONE OR MORE LIVE BIRTH, CM11=01 OR MORE 1	0⇒End

FERTILITY/BIRTH HISTORY**BH****BH0.** Now I would like to record the names of all of your births, whether still alive or not, starting with the first one you had.*Record names of all of the births in BH1. Record twins and triplets on separate lines.*

BH1. <i>BH</i> What name was given to your (first/next) baby?	BH2. Were any of these births twins?	BH3. Is (<i>name of birth</i>) a boy or a girl?	BH4. In what month and year was (<i>name of birth</i>) born?	BH5. Is (<i>name of birth</i>) still alive?	BH6. How old was (<i>name of birth</i>) at birth?	BH7. Is (<i>name of birth</i>) living with you?	BH8. Record household line number of child from HL1.	BH9. How old was (<i>name of birth</i>) when (he/she) died?	BH10. Were there any other live births between (<i>name of previous birth</i>) and (<i>name of birth</i>), including any children who died after birth?
S	M	B	G	Day	Month	Year

UCF8. Check UCF3: Child uses a hearing aid?	YES, UCF3=1 NO, UCF3=2	1 2 <i>1⇒UCF9A</i> <i>2⇒UCF9B</i>
UCF9A. When using (his/her) hearing aid(s), does (<i>name</i>) have difficulty hearing sounds like peoples' voices or music?	NO DIFFICULTY SOME DIFFICULTY A LOT OF DIFFICULTY..... CANNOT HEAR AT ALL.....	1 2 3 4
UCF9B. Does (<i>name</i>) have difficulty hearing sounds like peoples' voices or music?		
UCF10. Check UCF4: Child uses equipment or receives assistance for walking?	YES, UCF4=1 NO, UCF4=2	1 2 <i>1⇒UCF11</i> <i>2⇒UCF13</i>
UCF11. Without (his/her) equipment or assistance, does (<i>name</i>) have difficulty walking?	SOME DIFFICULTY A LOT OF DIFFICULTY..... CANNOT WALK AT ALL.....	2 3 4
UCF12. With (his/her) equipment or assistance, does (<i>name</i>) have difficulty walking?	NO DIFFICULTY..... SOME DIFFICULTY A LOT OF DIFFICULTY..... CANNOT WALK AT ALL.....	1 2 3 4 <i>1⇒UCF14</i> <i>2⇒UCF14</i> <i>3⇒UCF14</i> <i>4⇒UCF14</i>

UCF13. Compared with children of the same age, does (<i>name</i>) have difficulty walking?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT WALK AT ALL 4	
UCF14. Compared with children of the same age, does (<i>name</i>) have difficulty picking up small objects with (his/her) hand?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT PICK UP AT ALL 4	
UCF15. Does (<i>name</i>) have difficulty understanding you?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT UNDERSTAND AT ALL 4	
UCF16. When (<i>name</i>) speaks, do you have difficulty understanding (him/her)?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT BE UNDERSTOOD AT ALL 4	
UCF17. Compared with children of the same age, does (<i>name</i>) have difficulty learning things?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT LEARN THINGS AT ALL 4	
UCF18. Compared with children of the same age, does (<i>name</i>) have difficulty playing?	NO DIFFICULTY 1 SOME DIFFICULTY 2 A LOT OF DIFFICULTY 3 CANNOT PLAY AT ALL 4	
UCF19. The next question has five different options for answers. I am going to read these to you after the question. Compared with children of the same age, how much does (<i>name</i>) kick, bite or hit other children or adults? Would you say: not at all, less, the same, more or a lot more?	NOT AT ALL 1 LESS 2 THE SAME 3 MORE 4 A LOT MORE 5	

BREASTFEEDING AND DIETARY INTAKE			BD
BD1. Check UB2: Child's age?	AGE 0, 1, OR 2.....1 AGE 3 OR 4.....2		2⇒End
BD2. Has (<i>name</i>) ever been breastfed?	YES.....1 NO.....2 DK.....8		2⇒BD3A
BD3. Is (<i>name</i>) still being breastfed?	YES.....1 NO.....2 DK.....8		8⇒BD3A
BD3A. Check UB2: Child's age?	AGE 0 OR 1.....1 AGE 2	2	2⇒End
BD4. Yesterday, during the day or night, did (<i>name</i>) drink anything from a bottle with a nipple?	YES.....1 NO.....2 DK.....8		
BD5. Did (<i>name</i>) drink Oral Rehydration Salt solution (ORS) yesterday, during the day or night?	YES.....1 NO.....2 DK.....8		
BD6. Did (<i>name</i>) drink or eat vitamin or mineral supplements or any medicines yesterday, during the day or night?	YES.....1 NO.....2 DK.....8		

<p>BD7. Now I would like to ask you about all other liquids that (<i>name</i>) may have had yesterday during the day or the night.</p> <p>Please include liquids consumed outside of your home.</p> <p>Did (<i>name</i>) drink (<i>name of item</i>) yesterday during the day or the night:</p>				
		YES	NO	DK
[A] Plain water?	PLAIN WATER	1	2	8
[B] Juice or juice drinks?	JUICE OR JUICE DRINKS	1	2	8
[C] Hu'a supo?	CLEAR BROTH	1	2	8
[D] Infant formula, such as SMA, Karicare, S-26?	INFANT FORMULA	1	2 <small>♀</small>	8 <small>♀</small>
		<i>BD7[E]</i>	<i>BD7[E]</i>	
[D1] How many times did (<i>name</i>) drink infant formula? <i>If 7 or more times, record '7'. If unknown, record '8'.</i>	NUMBER OF TIMES DRANK INFANT FORMULA			
	DK.....	8		
[E] Milk from animals, such as fresh, tinned, or powdered milk?	MILK	1	2 <small>♀</small>	8 <small>♀</small>
		<i>BD7[X]</i>	<i>BD7[X]</i>	
[E1] How many times did (<i>name</i>) drink milk? <i>If 7 or more times, record '7'. If unknown, record '8'.</i>	NUMBER OF TIMES DRANK MILK			
[X] Any other liquids?	OTHER LIQUIDS	1	2 <small>♀</small>	8 <small>♀</small>
		<i>BD8</i>	<i>BD8</i>	
[X1] Record all other liquids mentioned. <i>(Specify)</i> _____				

<p>BD8. Now I would like to ask you about <u>everything</u> that (<i>name</i>) ate yesterday during the day or the night. Please include foods consumed outside of your home.</p> <p>Think about when (<i>name</i>) woke up yesterday. Did (he/she) eat anything at that time?</p> <p>If 'Yes' ask:</p> <p><i>Record answers using the food groups below.</i></p> <ul style="list-style-type: none"> - What did (<i>name</i>) do after that? Did (he/she) eat anything at that time? <p><i>Repeat this string of questions, recording in the food groups, until the respondent tells you that the child went to sleep until the next morning.</i></p>			
<p>For each food group not mentioned after completing the above ask:</p> <p>Just to make sure, did (<i>name</i>) eat (<i>food group items</i>) yesterday during the day or the night</p>			
<p>[A] Yogurt made from animal milk?</p> <p><i>Note that liquid/drinking yogurt should be captured in BD7[E] or BD7[X], depending on milk content.</i></p>			
<p>[A1] How many times did (<i>name</i>) eat yogurt?</p> <p><i>If 7 or more times, record '7'.</i></p>			
<p>[B] Any baby food, such as Cerelac, Gerber, Hero or Nestum?</p>			
<p>[C] Bread, rice, noodles, porridge, or other foods made from grains?</p>			
<p>[D] Pumpkin, carrots, squash, or sweet potatoes that are yellow or orange inside?</p>			
<p>[E] White potatoes, white yams, cassava, or any other foods made from roots?</p>			
<p>[F] Any dark green, leafy vegetables, such as taro leaves?</p>			
<p>[G] Ripe mangoes, ripe papayas, ripe banana?</p>			
<p>[H] Any other fruits or vegetables, such as watermelon, apple, pear, most commonly eaten fruits and vegetables?</p>			
<p>[I] Liver, kidney, heart or other organ meats?</p>			
<p>[J] Any other meat, such as beef, pork, lamb, goat, chicken, duck or sausages made from these meats?</p>			
<p>[K] Eggs?</p>			
<p>[L] Fish or shellfish, either fresh or dried?</p>			
<p>[M] Beans, peas, lentils or nuts, including any foods made from these?</p>			
<p>[N] Cheese or other food made from animal milk?</p>			

<input checked="" type="checkbox"/> Other solid, semi-solid, or soft food?	OTHER SOLID, SEMI-SOLID, OR SOFT FOOD BD9	1 BD9	2 ♂ BD9	8 ♂ BD9	
<small>[X1] Record all other solid, semi-solid, or soft food that do not fit food groups above.</small> <small>(Specify) _____</small>					
BD9. How many times did (<i>name</i>) eat any solid, semi-solid or soft foods yesterday during the day or night? <i>If BD8[A] is 'Yes', ensure that the response here includes the number of times recorded for yogurt in BD8[A1].</i> <i>If 7 or more times, record '7'.</i>					
<small>NUMBER OF TIMES</small> <small>DK..... 8</small>					

IMMUNISATION		IM

DATA COLLECTOR'S OBSERVATIONS

SUPERVISOR'S OBSERVATIONS

QUESTIONNAIRE FOR CHILDREN AGE 5-17
Tonga Multiple Indicator Cluster Survey 2019

5-17 CHILD INFORMATION PANEL		FS
FS1. Cluster number: _____	FS2. Household number: _____	
FS3. Child's name and line number: NAME _____	FS4. Mother's / Caretaker's name and line number: NAME _____	
FS5. Interviewer's name and number: NAME _____	FS6. Supervisor's name and number: NAME _____	
FS7. Day / Month / Year of interview: _____/_____/201_____	FS8. Record the time:	HOURS : MINUTES _____:____

Check respondent's age in HL6 in LIST OF HOUSEHOLD MEMBERS, HOUSEHOLD QUESTIONNAIRE:

If age 15-17, verify that adult consent for interview is obtained (HH33 or HH39) or not necessary (HL20=90). If consent is needed and not obtained, the interview must not commence and '06' should be recorded in FS17. The respondent must be at least 15 years old. In the very few cases where a child age 15-17 has no mother or caretaker identified in the household (HL20=90), the respondent will be the child him/herself.

FS9. Check completed questionnaires in this household: Have you or another member of your team interviewed this respondent for another questionnaire?	YES, INTERVIEWED ALREADY 1	1⇒FS10B
	NO, FIRST INTERVIEW 2	2⇒FS10A
FS10A. Hello, my name is (<i>your name</i>). We are from Tonga Statistics Department Office . We are conducting a survey about the situation of children, families and households. I would like to talk to you about (<i>child's name from FS3</i>)'s health and well-being. This interview will take about 40 minutes. All the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or wish to stop the interview, please let me know. May I start now?	FS10B. Now I would like to talk to you about (<i>child's name from FS3</i>)'s health and well-being in more detail. This interview will take about 40 minutes. Again, all the information we obtain will remain strictly confidential and anonymous. If you wish not to answer a question or wish to stop the interview, please let me know. May I start now?	
YES 1	1⇒CHILD'S BACKGROUND Module	
NO / NOT ASKED 2	2⇒FS17	

FS17. Result of interview for child age 5-17 years <i>Codes refer to the respondent.</i> <i>Discuss any result not completed with Supervisor.</i>	COMPLETED 01
	NOT AT HOME 02
	REFUSED 03
	PARTLY COMPLETED 04
	INCAPACITATED (specify) 05
	NO ADULT CONSENT FOR MOTHER/ CARETAKER AGE 15-17 06
	OTHER (specify) 96

CHILD'S BACKGROUND		CB
CB1. Check the respondent's line number (FS4) in 5-17 CHILD INFORMATION PANEL and the respondent to the HOUSEHOLD QUESTIONNAIRE (HH47);	FS4=HH47.....1 FS4#HH47.....2	1⇒CB11
CB2. In what month and year was (<i>name</i>) born? <i>Month and year must be recorded.</i>	DATE OF BIRTH MONTH.....— YEAR.....—	
CB3. How old is (<i>name</i>)? <i>Probe:</i> How old was (<i>name</i>) at (his/her) last birthday? <i>Record age in completed years.</i> <i>If responses to CB2 and CB3 are inconsistent, probe further and correct.</i>	AGE (IN COMPLETED YEARS).....—

FOUNDATIONAL LEARNING SKILLS			FL
FL0. Check CB3: Child's age?	AGE 5-6 YEARS AGE 7-14 YEARS AGE 15-17 YEARS	1 2 3	1⇒End 2⇒End 3⇒End
FL1. Now I would like to talk to (<i>name</i>). I will ask (him/her) a few questions about (himself/herself) and about reading, and then ask (him/her) to complete a few reading and number activities.			
These are not school tests and the results will not be shared with anyone, including other parents or the school.			
You will not benefit directly from participating and I am not trained to tell you how well (<i>name</i>) has performed.			
The activities are to help us find out how well children in Tonga are learning to read and to use numbers so that improvements can be made.			
This will take about 20 minutes. Again, all the information we obtain will remain strictly confidential and anonymous.			
May I talk to (<i>name</i>)?	YES, PERMISSION IS GIVEN..... NO, PERMISSION IS NOT GIVEN	1 2	2⇒FL28

FL2. Record the time.	HOURS AND MINUTES :		
FL3. My name is (<i>your name</i>). I would like to tell you a bit about myself.			
Could you tell me a little bit about yourself?			
<i>When the child is comfortable, continue with the verbal consent:</i>			
Let me tell you why I am here today. I am from Tonga Statistics Department Office . I am part of a team trying to find out how children are learning to read and to use numbers. We are also talking to some of the children about this and asking them to do some reading and number activities. (<i>Your mother/Name of caretaker</i>) has said that you can decide if you want to help us. If you wish to help us, I will ask you some questions and give you some activities to do. I will explain each activity, and you can ask me questions any time. You do not have to do anything that you do not want to do. After we begin, if you do not want to answer a question or you do not want to continue that is alright.			
Are you ready to get started?	YES NO / NOT ASKED	1 2	2⇒FL28

FL4. Before you start with the reading and number activities, tick each box to show that:			
<input type="checkbox"/> <i>You are not alone with the child unless they are at least visible to an adult known to the child.</i> <input type="checkbox"/> <i>You have engaged the child in conversation and built rapport, e.g. using an Icebreaker.</i> <input type="checkbox"/> <i>The child is sat comfortably, able to use the READING & NUMBERS BOOK without difficulty while you can see which page is open.</i>			
FL6. First we are going to talk about reading.	READS BOOKS AT HOME.....	YES 1 2	NO
[A] Do you read books at home?	READS BOOKS AT HOME.....	1 2	
[B] Does someone read to you at home?	READ TO AT HOME	1 2	

FL7. Which language do you speak most of the time at home? <i>Probe if necessary and read the listed languages.</i>	ENGLISH 1 TONGAN 2 OTHER (specify) 6 DK 8	
FL8. Check CB7: In the current school year, did the child attend school or any early childhood education programme? <i>CHECK ED9 IN THE EDUCATION MODULE IN THE HOUSEHOLD QUESTIONNAIRE FOR CHILD IF CB7 WAS NOT ASKED.</i>	YES, CB7/ED9=1 1 NO, CB7/ED9=2 OR BLANK 2	1⇒FL9A 2⇒FL9B

FL9A. What language do your teachers use most of the time when teaching you in class? FL9B. When you were in school, what language did your teachers use most of the time when teaching you in class? <i>Probe if necessary and name the listed languages.</i>	ENGLISH 1 TONGAN 2 OTHER (specify) 6 DK 8	1⇒FL10A 2⇒FL10A
FL9C. Check FL7: Is READING & NUMBERS BOOK available in the language spoken at home?	YES, FL7=1, 2 1 NO, FL7=6 OR 8 2	1⇒FL10B 2⇒FL10C
FL10A. Now I am going to give you a short story to read in (<i>Language recorded in FL9A/B</i>). Would you like to start reading the story? FL10B. Now I am going to give you a short story to read in (<i>Language recorded in FL7</i>). Would you like to start reading the story?	YES 1 NO 2	1⇒FL11
FL10C. I have short stories in English and Tongan. The stories are almost the same. Would you like to try one of them?	ENGLISH 11 TONGAN 12 DOES NOT WANT TO TRY 95	95⇒FL23
FL11. Check CB3: Child's age?	AGE 7-9 YEARS 1 AGE 10-14 YEARS 2	1⇒FL13
FL12. Check CB7: In the current school year, did the child attend school or any early childhood education programme? <i>CHECK ED9 IN THE EDUCATION MODULE IN THE HOUSEHOLD QUESTIONNAIRE FOR CHILD IF CB7 WAS NOT ASKED.</i>	YES, CB7/ED9=1 1 NO, CB7/ED9=2 OR BLANK 2	1⇒FL18B

FL13. Give the child the READING & NUMBERS BOOK in the language recorded for the test: Use response to FL10C if available. If not, use response to FL9A/B if available. Otherwise use response to FL7.

Open the page showing the reading practice item and say:

Now we are going to do some reading. Point to the sentence. I would like you to read this aloud. Then I may ask you a question.

Semisi is a boy. Tina is a girl. Semisi is 5. Tina is 6.

FL14. Did the child read every word in the practice correctly?	YES.....1 NO.....2	2⇒FL21D
FL15. Once the reading is done, ask: How old is Semisi?	CORRECT SEMISI IS 5 YEARS OLD.....1 OTHER ANSWERS2 NO ANSWER AFTER 5 SECONDS3	1⇒FL17
FL16. Say: Semisi is 5 years old and go to FL21D.		⇒FL21D
FL17. Here is another question: Who is older: Semisi or Tina?	CORRECT TINA IS OLDER THAN SEMISI1 OTHER ANSWERS2 NO ANSWER AFTER 5 SECONDS3	1⇒FL18A
FL18. Say: Tina is older than Semisi. Tina is 6 and Semisi is 5 and go to FL21D.		⇒FL21D
FL18A. Turn the page to reveal the reading passage. Say: Thank you. Now I want you to try this. and go to FL19.		⇒FL19
FL18B. Give the child the READING & NUMBERS BOOK in the language recorded for the test: Use response to FL10C if available. If not, use response to FL9A/B if available. Otherwise use response to FL7. Open the book on the page of the reading passage.		

FL19. Here is a story. I want you to read it aloud as carefully as you can.	Paul	is	in	Grade	two.	One	day,
	1	2	3	4	5	6	7
	Paul	was	going	home	from	school.	He
	8	9	10	11	12	13	14
	saw	some	red	flowers	on	the	way.
	15	16	17	18	19	20	21
	The	flowers	were	near	a	tomato	farm.
You will start here (<i>point to the first word on the first line</i>) and you will read line by line (<i>point to the direction for reading each line</i>).	22	23	24	25	26	27	28
	Paul	wanted	to	get	some	flowers	for
	29	30	31	32	33	34	35
	his	mother.	Paul	ran	fast	across	the
	36	37	38	39	40	41	42
	farm	to	get	the	flowers.	He	fell
	43	44	45	46	47	48	49
When you finish I will ask you some questions about what you have read.	down	near	a	banana	tree.	Paul	started
	50	51	52	53	54	55	56
	crying.	The	farmer	saw	him	and	came.
	57	58	59	60	61	62	63
	He	gave	Paul	many	flowers.	Paul	was
	64	65	66	67	68	69	70
	very	happy.					
If you come to a word you do not know, go onto the next word.	71	72					

FL20. Results of the child's reading.	LAST WORD ATTEMPTED (A) NUMBER ____	
	TOTAL NUMBER OF WORDS INCORRECT OR MISSED (B) NUMBER ____	
FL21. How well did the child read the story?	THE CHILD READ AT LEAST ONE WORD CORRECTLY.....1 THE CHILD DID NOT READ ANY WORD CORRECTLY.....2 THE CHILD DID NOT TRY TO READ THE STORY.....3	2⇒FL21D 3⇒FL21D

FL21A. Check FL20(B): Did the child incorrectly read or miss (E:7; T:II) or more words?	YES, AT LEAST (E:7; T:II) WORDS1 NO, LESS THAN (E:7; T:II) WORDS2	2⇒FL21D
FL21B. Now I am going to ask you a few questions about what you have read. <i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark 'No response' and say: Thank you. That is ok. We will move on.</i> <i>Make sure the child can still see the passage and ask:</i>		
[A] What grade is Paul in?	CORRECT (PAUL IS IN GRADE TWO).....1 INCORRECT2 NO RESPONSE / SAYS 'I DON'T KNOW'.....3	
[B] What did Paul see on the way home?	CORRECT (HE SAW SOME FLOWERS).....1 INCORRECT2 NO RESPONSE / SAYS 'I DON'T KNOW'.....3	
[C] Why did Paul start crying?	CORRECT (BECAUSE HE FELL).....1 INCORRECT2 NO RESPONSE / SAYS 'I DON'T KNOW'.....3	
[D] Check FL21B [A-C]: Did the child answer all three questions correctly?	YES, ALL FL21B[A-C]=11 NO, AT LEAST ONE RESPONSE = 2 OR 3.....2	2⇒FL21D
[E] Where did Paul fall (down)?	CORRECT ((PAUL FELL DOWN) NEAR A BANANA TREE).....1 INCORRECT2 NO RESPONSE / SAYS 'I DON'T KNOW'.....3	
[F] Why was Paul happy?	CORRECT (BECAUSE THE FARMER GAVE HIM MANY FLOWERS OR BECAUSE HE HAD FLOWERS TO GIVE TO HIS MOTHER).....1 INCORRECT2 NO RESPONSE / SAYS 'I DON'T KNOW'.....3	
FL21C. Did the child answer all questions in FL21B correctly?	YES, ALL FL21B[A]-[F]=11 NO, AT LEAST ONE RESPONSE = 2 OR 3.....2	1⇒FL23

FL21D. I have some other short stories in other languages. I have stories in (<i>English/Tongan</i>). The stories are almost the same. Would you like to try one?	ENGLISH 11 TONGAN 12 DOES NOT WANT TO TRY 95	95 ⇔ FL23
<i>The child cannot pick the same language as already attempted.</i>		
FL21E. Check CB3: Child's age?	AGE 7-9 YEARS 1 AGE 10-14 YEARS 2	1 ⇔ FL21G
FL21F. Check CB7: In the current school year, did the child attend school or any early childhood education programme? <i>CHECK ED9 IN THE EDUCATION MODULE IN THE HOUSEHOLD QUESTIONNAIRE FOR CHILD IF CB7 WAS NOT ASKED.</i>		
FL21G. Give the child the READING & NUMBERS BOOK in the language recorded in FL21D. <i>Open the page showing the reading practice item, point to the sentence and say: Just as before I would like you to read this aloud. Then I may ask you a question.</i>		
<i>John is a boy. Grace is a girl. John has 2 eggs. Grace has 3 eggs.</i>		
FL21H. Did the child read every word in the practice correctly?	YES 1 NO 2	2 ⇔ FL23
FL21I. Once the reading is done, ask: How many eggs does John have?	CORRECT (JOHN HAS 2 EGGS) 1 OTHER ANSWERS 2 NO ANSWER AFTER 5 SECONDS 3	1 ⇔ FL21K
FL21J. Say: John has 2 eggs. and go to FL23.		⇒ FL23
FL21K. Here is another question: Who has more eggs: John or Grace?	CORRECT (GRACE HAS MORE EGGS (THAN JOHN)...1 OTHER ANSWERS 2 NO ANSWER AFTER 5 SECONDS 3	1 ⇔ FL21M
FL21L. Say: Grace has more eggs. John has 2 eggs Grace has 3 eggs. and go to FL23.		⇒ FL23
FL21M. Turn the page to reveal the reading passage. Say: Thank you. Now I want you to try this. and go to FL21O.		⇒ FL21O
FL21N. Give the child the READING & NUMBERS BOOK in the language recorded in FL21D. <i>Open the book on the page of the reading passage.</i>		

<p>FL21O. Here is a story. I want you to read it aloud as carefully as you can.</p> <p>You will start here (<i>point to the first word on the first line</i>) and you will read line by line (<i>point to the direction for reading each line</i>).</p> <p>When you finish I will ask you some questions about what you have read.</p> <p>If you come to a word you do not know, go onto the next word.</p> <p>Put your finger on the first word. Ready? Begin.</p>	Jane	is	seven	years	old.	One	morning,
	1	2	3	4	5	6	7
	her	grandmother	sent	her	to	the	market
	8	9	10	11	12	13	14
	to	buy	some	tomatoes.	She	gave	Jane
	15	16	17	18	19	20	21
	some	money.	Jane	put	it	in	her
	22	23	24	25	26	27	28
	bag.	The	bag	had	a	big	hole.
	29	30	31	32	33	34	35
	On	the	way,	Jane	lost	her	money.
	36	37	38	39	40	41	42
	Peter	saw	the	money	and	gave	it
	43	44	45	46	47	48	49
	to	Jane.	She	was	happy.	Jane	thanked
	50	51	52	53	54	55	56
	Peter	and	walked	to	the	market.	
	57	58	59	60	61	62	63
	64	65	66	67	68	69	70
	71	72	73	74	75	76	77

<p>FL21P. Results of the child's reading.</p> <p><i>Incorrect or missed words (B) are those marked while reading plus the difference between the number of the last word in the story (E:62; T:97) and the last word attempted (A).</i></p>	LAST WORD ATTEMPTED (A) NUMBER ____	
	TOTAL NUMBER OF WORDS INCORRECT OR MISSED (B) NUMBER ____	
FL21Q. How well did the child read the story?	THE CHILD READ AT LEAST ONE WORD CORRECTLY.....1 THE CHILD DID NOT READ ANY WORD CORRECTLY.....2 THE CHILD DID NOT TRY TO READ THE STORY.....3	2⇒FL23 3⇒FL23

FL21R. Check FL21P: Did the child incorrectly read or miss (E:6;T:10) or more words (B)?	YES, AT LEAST (E:6; T:10) WORDS 1 NO, LESS THAN (E:6;T:10) WORDS 2	1⇒FL23
FL22. Now I am going to ask you a few questions about what you have read. <i>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, mark 'No response' and say: Thank you. That is ok. We will move on.</i> <i>Make sure the child can still see the passage and ask:</i>		
[A] How old is Jane?	CORRECT (JANE IS SEVEN)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW'..... 3	
[B] Who sent Jane to the shop?	CORRECT (HER GRANDMOTHER)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW'..... 3	
[C] What was Jane asked to buy?	CORRECT (TOMATOES OR SHE WAS SENT TO BUY SOME TOMATOES) 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW'..... 3	
[D] Check FL22 [A-C]: Did the child answer all three questions correctly?	YES, ALL FL22[A-C]=1 1 NO, AT LEAST ONE RESPONSE = 2 OR 3 2	2⇒FL23
[E] How did Jane lose the money?	CORRECT (BECAUSE IT FELL THROUGH THE HOLE IN THE BAG OR BECAUSE THE BAG HAD A HOLE)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW'..... 3	
[F] Why was Jane happy?	CORRECT (BECAUSE PETER GAVE HER THE MONEY)..... 1 INCORRECT 2 NO RESPONSE / SAYS 'I DON'T KNOW'..... 3	

<p>FL23. Turn the page in the READING & NUMBERS BOOK so the child is looking at the list of numbers. Make sure the child is looking at this page.</p> <p>Now here are some numbers. I want you to point to each number and tell me what the number is.</p> <p>Point to the first number and say:</p> <p>Start here.</p> <p>If the child stops on a number for a while, tell the child what the number is, mark the number as 'No Attempt', point to the next number and say:</p> <p>What is this number?</p> <p>STOP RULE</p> <p>If the child does not attempt to read 2 consecutive numbers, say:</p> <p>Thank you. That is ok.</p>	<p>9 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>12 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>30 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>48 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>74 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p> <p>731 CORRECT 1 INCORRECT 2 NO ATTEMPT 3</p>	
<p>FL23A. Check FL23: Did the child correctly identify two of the first three numbers (9, 12 and 30)?</p>	<p>YES, AT LEAST TWO CORRECT 1 NO, AT LEAST 2 INCORRECT OR WITH NO ATTEMPT 2</p>	<p>2 \Rightarrow FL28</p>
<p>FL24. Turn the page so the child is looking at the first pair of numbers. Make sure the child is looking at this page. Say:</p> <p>Look at these numbers. Tell me which one is bigger.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next pair of numbers.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', no attempt, for the appropriate pair of numbers, turn the booklet page and show the child the next pair of numbers.</p> <p>If the child does not attempt 2 consecutive pairs, record '3', no attempt, for remaining pairs and say:</p> <p>Thank you. That is ok. We will go to the next activity.</p>	<p>7 & 5 CORRECT (7) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>11 & 24 CORRECT (24) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>58 & 49 CORRECT (58) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>65 & 67 CORRECT (67) 1 INCORRECT 2 NO ATTEMPT 3</p> <p>146 & 154 CORRECT (154) 1 INCORRECT 2 NO ATTEMPT 3</p>	

<p>FL25. Give the child a pencil and paper. Turn the page so the child is looking at the first addition. Make sure the child is looking at this page. Say:</p> <p>Look at this sum. How much is (<i>number plus number</i>)? Tell me the answer. You can use the pencil and paper if it helps you.</p> <p>Record the child's answer before turning the page in the book and repeating the question for the next sum.</p> <p>If the child does not provide a response after a few seconds, repeat the question. If the child seems unable to provide an answer after repeating the question, record '3', no attempt, for the appropriate sum, turn the booklet page and show the child the next addition.</p> <p>If the child does not attempt 2 consecutive sums, record '3', no attempt, for remaining sums and say:</p> <p>Thank you. That is ok. We will go to the next activity.</p>	<p>3 + 2</p> <table border="0"> <tr><td>CORRECT (5).....</td><td>1</td></tr> <tr><td>INCORRECT</td><td>2</td></tr> <tr><td>NO ATTEMPT</td><td>3</td></tr> </table> <p>8 + 6</p> <table border="0"> <tr><td>CORRECT (14).....</td><td>1</td></tr> <tr><td>INCORRECT</td><td>2</td></tr> <tr><td>NO ATTEMPT</td><td>3</td></tr> </table> <p>7 + 3</p> <table border="0"> <tr><td>CORRECT (10).....</td><td>1</td></tr> <tr><td>INCORRECT</td><td>2</td></tr> <tr><td>NO ATTEMPT</td><td>3</td></tr> </table> <p>13 + 6</p> <table border="0"> <tr><td>CORRECT (19).....</td><td>1</td></tr> <tr><td>INCORRECT</td><td>2</td></tr> <tr><td>NO ATTEMPT</td><td>3</td></tr> </table> <p>12 + 24</p> <table border="0"> <tr><td>CORRECT (36).....</td><td>1</td></tr> <tr><td>INCORRECT</td><td>2</td></tr> <tr><td>NO ATTEMPT</td><td>3</td></tr> </table>	CORRECT (5).....	1	INCORRECT	2	NO ATTEMPT	3	CORRECT (14).....	1	INCORRECT	2	NO ATTEMPT	3	CORRECT (10).....	1	INCORRECT	2	NO ATTEMPT	3	CORRECT (19).....	1	INCORRECT	2	NO ATTEMPT	3	CORRECT (36).....	1	INCORRECT	2	NO ATTEMPT	3
